Everything done, 22–23 October

Groundwork by Jalla · one continuous session, 22 Oct 01:13 → 23 Oct 03:07

PREPARED FOR PHILIP, RUTH AND THE TEAM

A complete record, including the morning's work that the 22 October memo already covered, so nothing has to be read in two places. Nineteen migrations written, 139 to 157, all applied. Philip's video walkthrough and his form document were implemented in full bar two items, named below. Nine faults were found and fixed — four in the morning, three by running the live product at the end of the day, and two of my own. 174 test files and 3,214 tests pass.

1 Decisions taken, and why

Philip — the application, from his walkthrough and form document

Specialty replaces the licence page	A dropdown of thirteen trades with an Other box. An applicant wrote in: a mason and bricklayer of several years, no formal licence, no registered company — and three separate places demanding a licence number. Of the onboarding records on the system, fourteen of seventeen were independent and none was a registered business.
Licence only where the profession is regulated	Architect, structural engineer, quantity surveyor, land surveyor, land lawyer. A mason, carpenter, electrician, plumber, roofer or finisher is never asked.
Emergency contacts: three to one	Speed onto the platform is what that step is for; more can be added later from the profile.
"How do you trade" removed from onboarding	The application still asks individual or company, which is where the answer is used.
"I'll do this later" on payment removed	Choosing it left the step outstanding, which then blocked the contact screen — the escape hatch trapped people.
"I don't have a client" goes to the dashboard	Having a client is a condition of applying, so they are no longer sent to a form they cannot qualify on.
No call without qualifying	Checked before a slot is offered, not after.
The last page books the call	It used to say somebody would write to arrange one, on the very page already offering the calendar.
Pricing page removed	Route, component, navigation and footer.
A disqualifying answer ends the application	They do not see the remaining steps; they are sent to a thank-you page. Ten questions answered by somebody who was out at question four is ten questions of their evening, and a row in Ruth's queue that looks like a lead.
Three disqualifiers, and only three	No project; the client can be on site daily; they would not use Groundwork.
Years of experience no longer disqualifies	It ranks an applicant in the directory instead. **Reverses the 22 October decision** that under five years could not book. A three-year mason with a live diaspora client now reaches the calendar.
A client who *can* be on site daily is disqualified	The follow-up asks why they cannot come, with an Other. Reads backwards until you see it: Groundwork is for the client who cannot stand on the slab, and Philip was explicit that this is not only the diaspora.

"Maybe, I need to understand the system better" proceeds	That answer is a request for the demo, which is what the call is for.
"Will you introduce the client?" is dropped	Under the new rules anybody reaching the end has a live project, an absent client and the intention to run it here.
The rejection message stays warm	*"The method should still be calming marketing… so they don't get pissed off and feel like you're not good enough."*
Vanessa co-hosts every booking	English included. A Google co-host sits on the schedule, not on a booking, so "Vanessa for French speakers" cannot be expressed that way. Now under review — see Ruth's two-link proposal.

Ruth — reporting, the admin surface, and the funnel

The dashboard is data collection, not the report	*"Use the Admin dashboard as the data collection, not the accurate representation of reports. The data it produces still needs to be cleaned up and converted to an accurate report."* *She is right. The 22 October footnote saying the figures were "not worth quoting" was the wrong instruction and is withdrawn. The cleanup is now done once in the data.*
Rejection reasons show on the admin, from both sides	Whether the form ended it or a person did. A rejection after a call was a bare status flip: Ruth decided, the applicant was emailed, and three weeks later nobody could say what was wrong.
Two booking links, not one	English without Vanessa; French with Vanessa and Philip. **Awaiting Philip.** Better than the email workaround, but Vanessa should not own them: a schedule offers slots from its *owner's* calendar, so applicants would book against her free time rather than Philip's, and only the owner can edit it.
Daily reporting cadence	Reports between 9 and 10 pm Nigerian time. Ruth's call for a tight execution week.
partner@tryjalla.com is her admin account	Done. It held a contractor role from her testing — the session overlap she reported. She signs in with forgot-password.
Applicants must be reviewable from the pipeline	*"I clicked the partner pipeline and also the applied box but it did nothing."*

Favour — scope and priority

Three questions per page, not one per step	With hard stops on the deciding questions. Philip asked for one per step; the team had decided three-per-page on 22 October in his absence. Three-per-page satisfies his stated reason for far less rework.
Copy outranks admin automation	*"One helps the backend team have a marginal efficiency increase, the other improves Client and Contractor perception by a significant margin."* *Acted on the same day.*
"Groundwork by Jalla"	Groundwork is the product; Jalla is the firm. An earlier reading of "Groundwork 103 / Jalla 99" as drift was **wrong and is withdrawn**. The pass became finding misuses, and there are none.
Partners and contractors are different things	*"There are contractors who are partners and there are mere contractors."*
Say up front who the partner programme is for	Added at the onboarding question and at the top of the application, in both languages. A contractor may legitimately have no project and simply be signing up. Nobody should spend nine questions discovering that today is not their day.
One question at a time, as three pages of three	Nine single-question screens would be a slog for a short application; one long form is what people abandoned.
Admin emails hold only the admin role	Enforced across every staff account.

The two test contractor listings stay for now	Flagged as visible to clients; left in place on instruction.

2 Implemented

Contractor onboarding and the public application — migrations 139–144

Specialty replaces the licence page	LIVE Thirteen trades with an Other box; licence asked only of the five regulated professions.
Emergency contacts: one is enough	LIVE
Drafts write through a function	LIVE The table is closed to direct writes because the rows hold applicants' names, phones and emails.
Draft capture restored	LIVE Two correct rules had together made the only operation the form performs impossible.
Owner can create a project	LIVE The wizard reads the new project back, and the rule guarding that read asked about a row that did not exist yet.
Pricing page removed	LIVE Route, component, navigation, footer and the plan-selection step.

Partner funnel and the admin board — migrations 145–148, 151

The partner pipeline board	LIVE Every applicant at the furthest stage reached, sorted by what needs doing rather than who joined last.
Review, decision and directory inside the funnel	LIVE Marking a call held moves a pending application into review by itself.
Accepted partners reach the directory intact	LIVE Years, trade, location and account link were being lost on publication.
Stage tiles filter; each row opens the application	LIVE Ruth's two blockers. The tiles were dead numbers; there was no route to the answers.
Partners separated from contractors	LIVE "7 partner applicants; 25 contractor accounts have never applied."
Our own accounts excluded from reported figures	LIVE Flagged in the data, excluded by default, available on demand.

The new application, and rejection capture — migrations 152–154

Partner application rebuilt	LIVE Branching project question with sub-questions, three hard stops, thank-you page, the document's exact wording and options.
Parent/sub integrity in the table	LIVE A stage against a project that has not started is refused by the database, not just by one screen.
Rejected applicants captured	LIVE Filed as *disqualified* with the rule that ended it. A disqualified row never blocks a fresh application.
Two endings, not one	LIVE Somebody the form stopped and somebody Ruth turned down are different people needing different follow-up.

Rejection reasons, both sides	LIVE Six staff reasons plus a note; rejecting now asks why before it commits, and attributes the decision from the session.

Language and copy — migration 149

Language follows the person, not the browser	LIVE `preferred_lang` had been written since migration 025 and never read back.
Notifications read in the reader's language	LIVE A message excerpt is never translated — it is what somebody typed.
Stage names translated everywhere	LIVE Two client-facing leaks, plus a guard so the class cannot return.
15 error messages rewritten	LIVE Each now says what to do.
Delete confirmation in French	LIVE French users type SUPPRIMER; the check had compared against a hard-coded "DELETE".
No payment provider named to customers	LIVE The upgrade screen told clients billing waited on Stripe.
Dictionary audited	CLEAN 4,817 strings: zero custody violations, zero vocabulary misuses, zero missing French keys.

Accounts, operations and documents

Admin accounts provisioned	DONE Ruth, Periscal and the shared account; every admin email now holds only the admin role.
Vanessa kept as a contractor	DONE She is fully contractor, so her account is not an admin.
Client-facing directory audited	REPORTED Three listings, two of them test rows visible to clients. Left in place on instruction.
The form, as an editable document	SENT `Partner-Application-Form.docx`.
22 October status memo	SENT Plus this record.
End-to-end pass of the live product	DONE Nine public routes, the language toggle, both partner paths, the admin board, the reject flow, eleven client surfaces.

3 Not implemented, and why

Company name and website/social	NOT BUILT In the form document, asked when somebody answers "a company". One field and one column.
Specialization re-asked in the application	DELIBERATE The document re-adds it; it was removed on 22 October because onboarding already collects it and re-asking was the friction that cost qualified professionals. Shown prefilled, not asked. **Philip's call to reverse.**
One question per step	SUPERSEDED By the three-per-page decision.
Vanessa's address for French applicants	BLOCKED One row of configuration. Until it is set, **nothing tells her a French applicant has come in.**
Two booking links	AWAITING PHILIP Needs his decision and the second link.
Verifier assignment notifications	OUT OF SCOPE Still English; the body names a discipline that would itself need translating.
"Join as a contractor" on the home page	TEAM DECISION Proposed for removal as duplicating "Join for Free"; not actioned.
Civil Engineer in the trade list	TEAM DECISION The list has Structural Engineer.

4 Faults found and fixed

Nine in one session. The last three surfaced only by driving the live product as a client, a contractor and an admin — none had been caught by 3,214 automated tests.

A mason could not register at all	FIXED The form demanded a professional licence in three places. It was not collecting credentials; it was turning away the honest.
No client could create a project	FIXED The same fault had been fixed for contractors months earlier, with the rule written down. The client case was missed.
Abandoned applications were not captured	FIXED Cost us data: those in the window left no trace and cannot be recovered.
"All three emergency contacts are required"	FIXED — MINE The change was written against a function with the wrong name. It passed its test because the test called the function I had just written rather than the one the product uses.
Ruth saw "Book your call below" with no calendar	FIXED — MINE A correction that created the opposite contradiction.
Migration 146 would not apply	FIXED — MINE CREATE OR REPLACE cannot change a function's return type. The scratch test built the cluster fresh, so the conflict could not arise.
A disqualified applicant hit a dead end	FIXED Choosing "No, I don't have a project" left *Next* disabled — the opposite of Philip's instruction.

A partner on a second device could never save	FIXED Every keystroke returned 409, silently. All nine unlinked drafts on the system are first-device saves.
A partner applicant could not be deleted at all	FIXED Neither the admin's delete nor a user's own deletion request could be carried out.

> **And one fault of my own, introduced and fixed the same evening.** The fix for the second-device bug reordered a function's parameters. Parameter order is part of a function's identity in PostgreSQL, so it created a second function rather than replacing the first, and the API could no longer choose between them. For roughly twenty minutes *every* draft save failed — worse than the bug it replaced, which affected only second devices. Migration 157 removed the duplicate; draft capture is confirmed restored. Recorded because the same trap was avoided twice earlier the same evening, and the reason it was missed is that reordering parameters does not look like changing a signature. It is.

5 Where the funnel actually stands

Cleaned of our own accounts — which the system now does by itself.

MEASURE	REAL	RAW
Applications submitted	**7**	**11**
Decision-ready candidates	**3**	**6**
Started and not finished	**3**	**7**

The three decision-ready are **Chimewah Joseph**, **Boukili Behalal Léonel** and **Eta Rapheal Bissong** — meeting the Friday target of three. "Started and not finished" fell from seven to three because four of those people *had* applied; their drafts were never closed. One is Joseph, who was being chased as an abandoner while waiting on a call. The nine I reported at standup was wrong for the same reason, compounded by test accounts and legacy August rows.

6 Remaining, non-critical

- **Two test listings are live in the client-facing directory** — "ben" (throwaway address, zero years) and "Ruth Ijoma". Clients browsing contractors see them. Deactivating is one statement.
- **Vanessa's directory listing is thin** — no specialties, free-text trade. She is the only genuine listing of the three; none came through the accept flow, so re-promotion cannot repair them.
- **Nigeria still appears in the project wizard** though Nigeria is on pause.
- **37 gwtest accounts** remain on production. One blocker was removed today; the audit-log reference may still hold them.
- Four "coming soon" strings; one dead navigation key; `country.NG` reads "Nigeria" rather than "Nigéria" in French.
- The shared admin `phavorfavor@gmail.com` has no name, and being shared it cannot attribute a decision to one person.
- Test credentials used during the week should be rotated.

> **Verification.** 174 test files and 3,214 tests pass; types and production build clean. Migrations 139–157 applied and checked against production. Every account created for testing has been deleted, including a temporary admin; admin count is unchanged at five, and no admin holds another role.
