Product Working Session

Invited Favour Nwachukwu Philip n. Tete Ruth Ijoma

Attachments Product Working Session
Product Working Session - 2026/11/10 15:30 WAT - Recording Notes by Gemini

Meeting records Transcript *(Some recordings unavailable)*

Summary

Platform review resolved financial discrepancies and refined client dashboard permissions with UI consistency.

Bill of Quantity Fixes
Currency conversion discrepancies between storage and display values were resolved via a database migration. Building types were made editable to correct system misidentifications during document uploads.

Dashboard Design Updates
Payout tracking will use uploaded payment receipts as the definitive source of truth rather than theoretical stage costs. Primary dashboard colors were aligned with the contractor interface.

Feature Adjustments and Removal
The upload updates feature was removed from the main dashboard due to incomplete backend handling. Empty resource tabs were hidden to improve the user experience.

Decisions

Disagreements

- **Active stage color scheme for dashboard** Participants actively debated whether to use gray or amber colors to represent active stages on the client dashboard without reaching a final agreement.

Aligned

- **Platform project permission and invitation structure** The platform will mirror real-life roles by allowing clients who invite primary contractors to let those contractors invite other project participants.
- **Client dashboard terminology and UI standards** The client dashboard will use design consistency with the contractor view, use the term "approved", and remove unnecessary legacy UI elements.
- **Payment receipt as budget payout source** The payout numbers on the budget will use uploaded payment receipts as the source of truth instead of strict stage costs.
- **Client dashboard brand color consistency standard** The client dashboard will maintain a single consistent brand color representation to ensure a sophisticated product appearance.
- **Merge stage breakdown and payment timeline** The team agreed to merge the stage breakdown and payment timeline into a single element.
- **Establish green as primary color** The team decided to use the contractor dashboard green as the primary color for call-to-action elements.
- **Remove cost allocation and upload updates** The team decided to remove the cost allocation and upload updates sections from the main client dashboard.
- **Create project team tab** The team decided to create a new team or people tab within the project view for sharing.
- **Hide two-factor authentication action** The team decided to hide the two-factor authentication action item for now to prevent negative user experience.

Next steps

- [ ] [Philip n. Tete] Update Copy: Refine invitation emails and naming conventions for current stage payments to improve clarity. Ensure these updates align with the overall client experience.
- [ ] [Favour Nwachukwu] Enable Building Edit: Implement functionality to make the building type field editable for users. Verify the system correctly identifies and updates the selected building classification.
- [ ] [Favour Nwachukwu, Ruth Ijoma] Test Client Flow: Execute a test by creating a project from the client perspective and inviting a contractor. Confirm the bill of quantities upload and project initialization process function correctly.
- [ ] [Philip n. Tete, Favour Nwachukwu] Map Scope: Map out the full scope of changes required for the client side of the platform.
- [ ] [Favour Nwachukwu] Update Design: Update the client dashboard to match the design consistency of the contractor view, including font and color schemes.
- [ ] [Favour Nwachukwu] Add Currency: Incorporate the USD equivalent display for all cost figures on the client side.
- [ ] [Favour Nwachukwu] Reorganize CTA: Remove the share your build call to action from the project overview and relocate it under settings.
- [ ] [Favour Nwachukwu] Rename CTA: Rename the share your build call to action to share this project.
- [ ] [Favour Nwachukwu] Update Payout Logic: Change the payout tracking logic to use the uploaded receipt as the source of truth instead of the stage cost.
- [ ] [Favour Nwachukwu] Clean Dashboard: Remove unnecessary elements from the client dashboard including latest updates on the site and latest on the project sections.
- [ ] [Favour Nwachukwu] Standardize Terminology: Implement the approved label for reviewed evidence instead of verified.
- [ ] [Favour Nwachukwu] Merge Payment Timeline: Merge the payment timeline and stage breakdown into a single element, while maintaining the established design pattern.
- [ ] [Favour Nwachukwu] Standardize Timeline Color: Update the project timeline

display to represent completion dates consistently without using mixed colors.

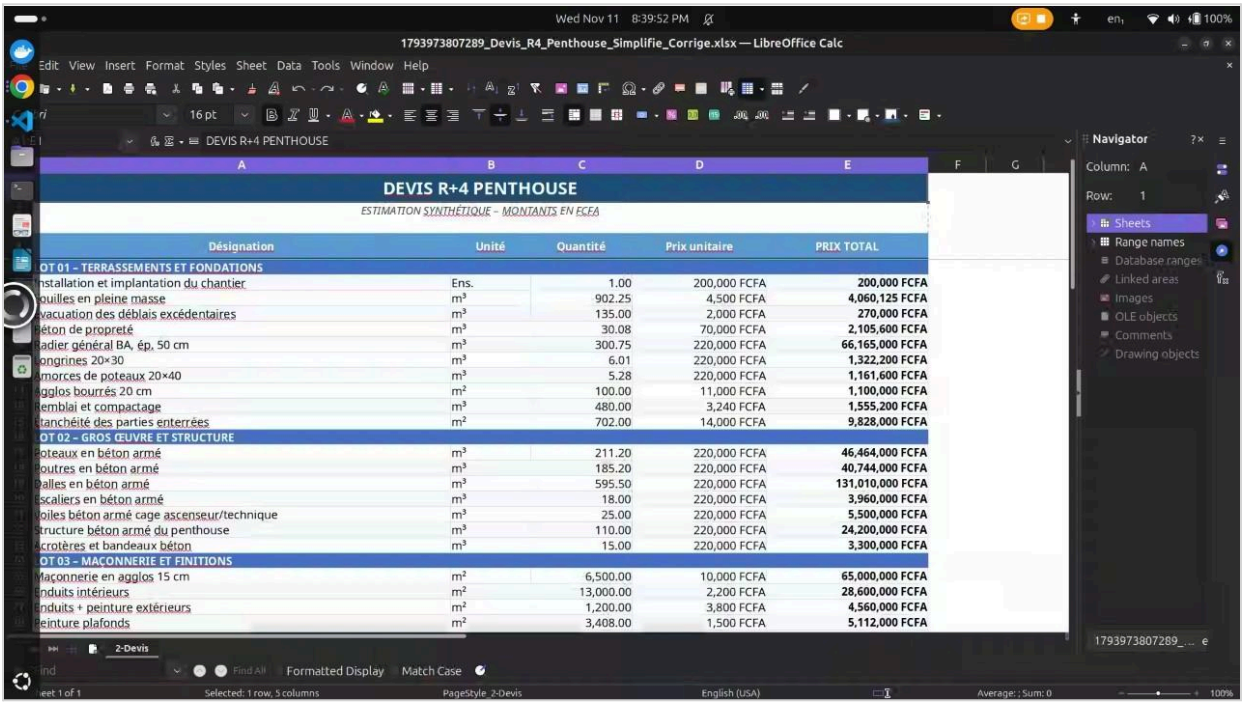

- [ ] [Favour Nwachukwu] Enable Excel Preview: Investigate and implement a solution to preview Excel files directly on the web.
- [ ] [Favour Nwachukwu] Fix Document Visibility: Ensure that the documents and certificates sections only display items that have been uploaded or formally issued.
- [ ] [Favour Nwachukwu] Enable Document Clicks: Make uploaded documents clickable in the document view to enable proper viewing.
- [ ] [Favour Nwachukwu] Relocate Bill of Quantities: Move the Bill of Quantities functionality to the contractor and admin views, removing it from the client-facing side.
- [ ] [Favour Nwachukwu] Rename Take Off Action: Rename the Start a Take Off call to action to something that clearly reflects the intent to edit the bill of quantities.
- [ ] [Favour Nwachukwu] Update On Hold Status: Update the on hold status display on the project homepage to remove the generic create your first project prompt.
- [ ] [Favour Nwachukwu] Apply Primary Color: Change the primary color of the dashboard to green as discussed.
- [ ] [Favour Nwachukwu] Clean Client Dashboard: Remove the upload updates and cost allocation sections from the client main dashboard.
- [ ] [Favour Nwachukwu] Remove Empty Resources: Remove or hide the empty video section from the resources tab.
- [ ] [Favour Nwachukwu] Move Share Feature: Relocate the share bill of quantities functionality into a team tab within project settings.
- [ ] [Favour Nwachukwu] Hide 2FA Action: Hide the setup two factor authentication action from the client view until a direct link to the configuration page is implemented.
- [ ] [Ruth Ijoma] Schedule Review: Send a meeting invitation for the follow-up review in 4 hours.

Details

Partner Application Form Draft Retention: Favour Nwachukwu addressed an issue concerning the partner application form where users navigating away from the page were reset to the beginning (00:18:11). Favour Nwachukwu explained that while the system captured data progressively, it failed to retain the page state upon exit. To resolve this, Favour Nwachukwu added a partner draft use case to retain messages even if users left the page, provided they continued on the same device (00:18:11). Favour Nwachukwu confirmed that this fix for Vanessa's company has already been deployed (00:18:11).

Bill of Quantity Currency Conversion Discrepancy: Favour Nwachukwu identified the root cause behind figure discrepancies between uploaded bills of quantities and system displays, noting that the system stores data in United States Dollars while displaying local currency. When a project is created, the system uses the current daily exchange rate to convert the stored United States Dollar equivalent back to local currency, causing a slight, unintended increase in the final project amount compared to the original bill of quantity upload (00:13:18). Favour Nwachukwu noted that separate code implementations for client and contractor budget presentations contributed to conflicting behaviors (00:15:09). Favour Nwachukwu reported fixing this issue after running a database migration (00:00:10) (00:16:55).

Bill of Quantity Total Amount Extraction Bug: Favour Nwachukwu discussed a bug where uploading a bill of quantity written in French caused the system to extract the largest numerical total rather than the designated general total, leading to incorrect figure extraction. Favour Nwachukwu pointed out the difficulty in standardizing rules for bill of quantity formats since layouts vary across contractors (00:03:39) (00:08:55). Philip n. Tete noted that totals typically represent the largest number, but acknowledged the extraction error (00:10:30). Following database migration errors, Favour Nwachukwu resolved the migration issue to allow further testing (00:00:10) (00:08:55).

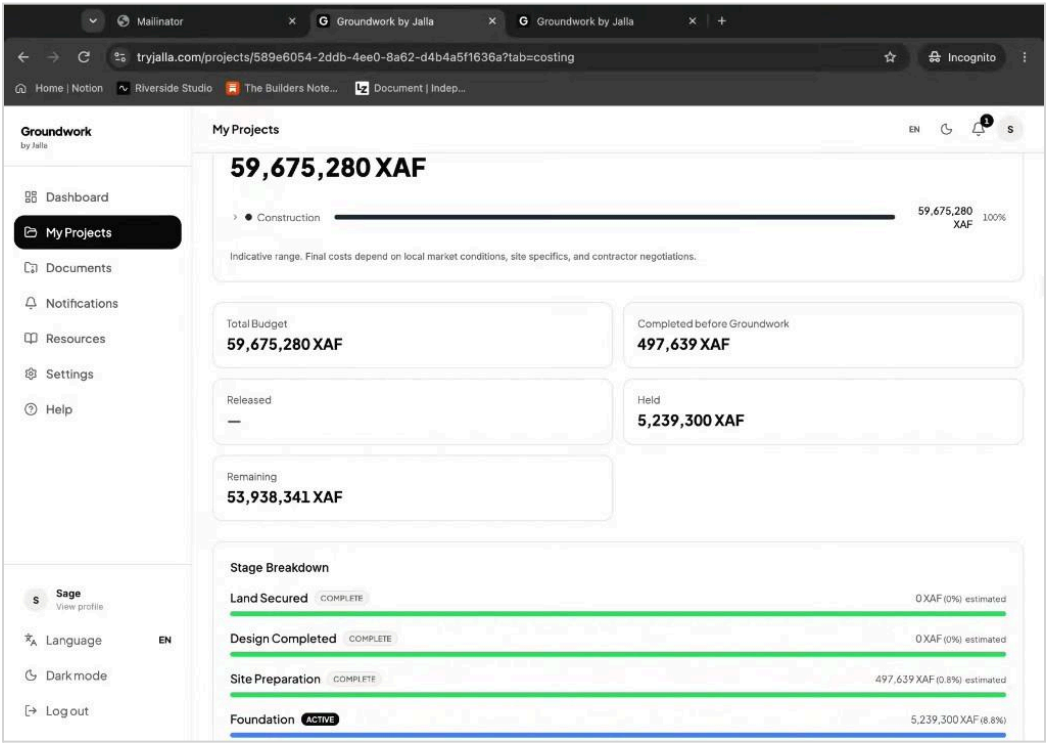

Software Regression Bugs: Favour Nwachukwu expressed frustration regarding regression bugs, explaining that deploying new fixes occasionally overwrites previously resolved and tested features, reverting them to older versions (00:06:05). Favour Nwachukwu noted that bundling four to five fixes together to save time makes it difficult to trace how newer code impacts older deployed versions. Favour Nwachukwu stated that their current focus is ensuring these fixes remain stable and that regression bugs do not reoccur (00:07:33).

Contractor Bill of Quantity Upload Testing: Ruth Ijoma shared their screen to test a bill of quantity upload from a contractor's perspective (00:18:11). During the test, Ruth Ijoma uploaded a file, and Favour Nwachukwu verified that the extracted total of 59,675,280 matched the document (00:20:18). Favour Nwachukwu noted a limitation where users cannot invite more than one client at a time from the people section (00:26:33).

Client Invitation and Email Localization: Philip n. Tete accepted an invitation sent during the testing phase and confirmed that the invitation email was received in English rather than French. Philip n. Tete highlighted the need to review the copy for

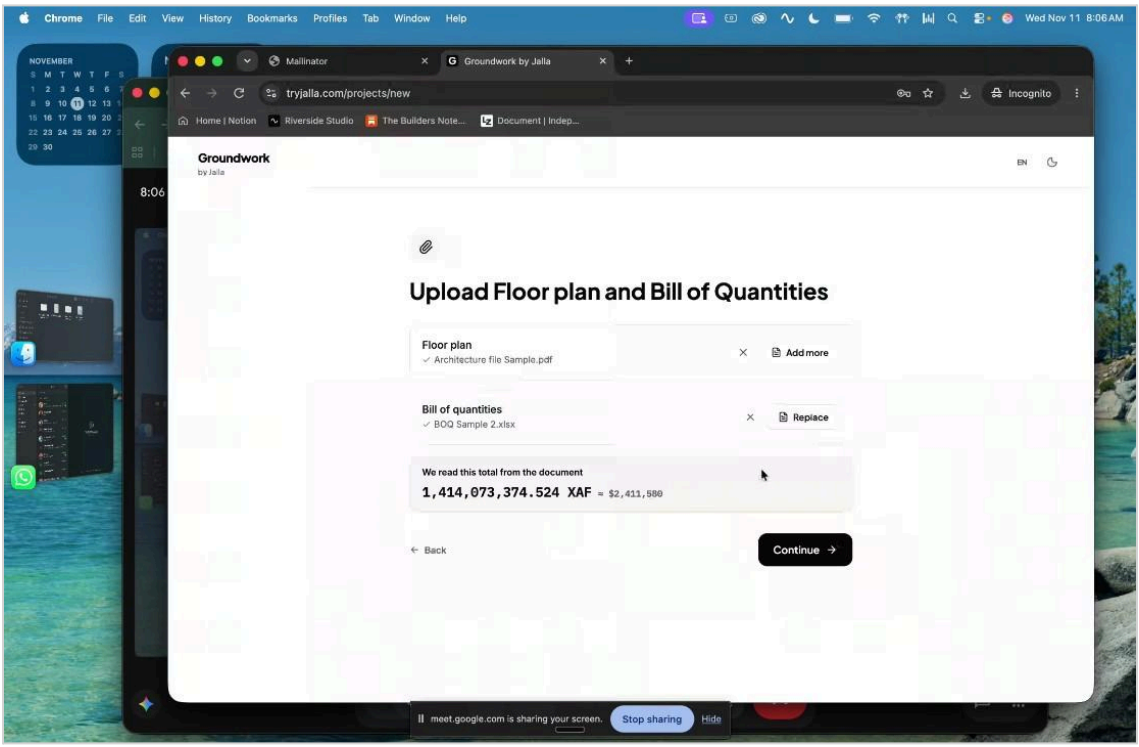

invitations since external clients, such as those from Olivia's group, are scheduled to receive invitations at 4:00 p.m. that day (00:26:33). Favour Nwachukwu noted that the participant interface should update from pending to accepted upon page refresh (00:28:31).

Stage Payment Copy and Interface Terminology: Philip n. Tete reviewed the current stage money distribution on the client view and suggested renaming the term "held" to something clearer, such as "current stage payment," to improve user comprehension (00:28:31). Philip n. Tete emphasized that copy changes should follow after cleaning up the core client experience (00:30:22). Favour Nwachukwu pointed out discrepancies in the payment trail reading between contractor and client views (00:31:46).

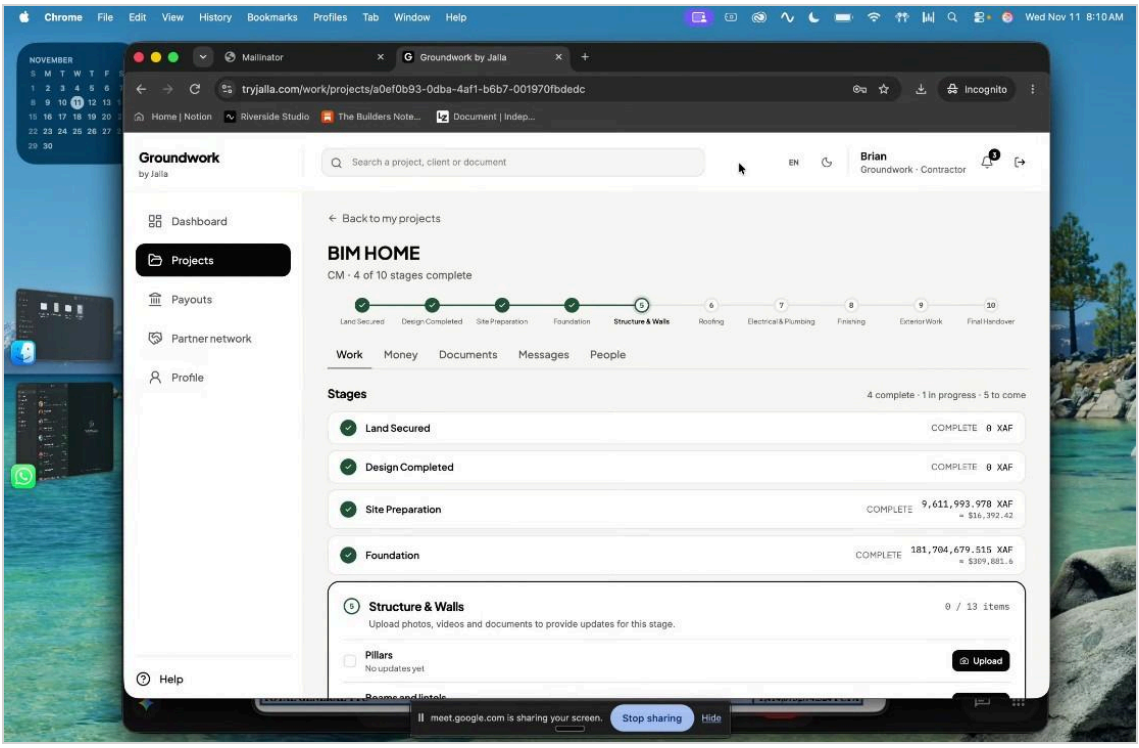

Second Bill of Quantity Upload and Floor Plan Costing: Philip n. Tete shared their screen to test another contractor bill of quantity upload, yielding a total of 14,140,733.74 (00:32:57). Philip n. Tete observed a secondary figure of 190,000 on the screen and suspected it remained tied to floor plan costing pathways. Favour Nwachukwu and Philip n. Tete discussed that building types are frequently misidentified by the system, leading to a decision to make building types editable

(00:36:00).

Project Financial Representation and Next Testing Steps: Philip n. Tete reviewed the financial representation, confirming that funds correctly display in local currency with United States Dollar equivalents and distribute appropriately across stages. Philip n. Tete acknowledged potential contractor complaints regarding funds or designs not being linked initially, but agreed to address feedback as it arises. Favour Nwachukwu proposed conducting further tests on bill of quantity uploads from the client perspective, where a client creates a project and invites a contractor (00:41:57).

Contractor Invitation and View Verification: Favour Nwachukwu instructs Philip n. Tete and Ruth Ijoma to test inviting a contractor via Sinuator.com to verify that the figures match across documents. Ruth Ijoma confirms the invitation email arrives in English, accepts the invitation, logs out, and logs back into a contractor account to review the project (00:43:44). Ruth Ijoma confirms that the project view and figures are correct on the contractor end (00:47:33).

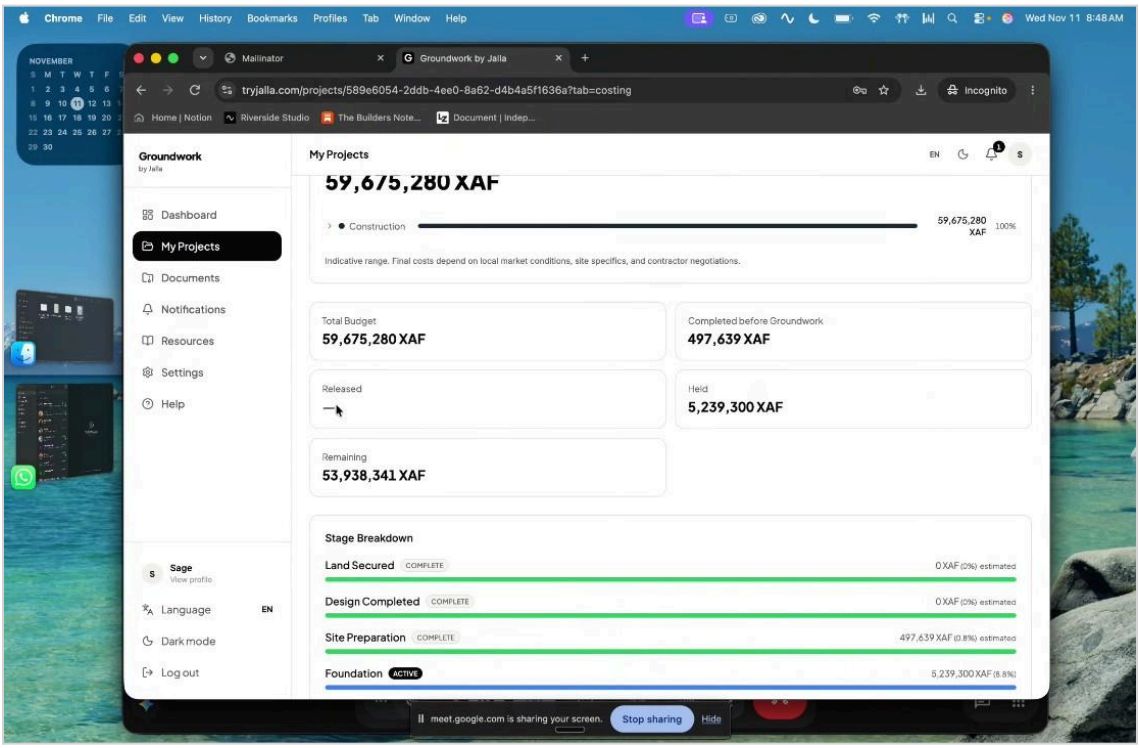

Platform Permissions and Project Ownership Logic: Philip n. Tete discusses platform ownership logic, arguing that it should mirror real life so that once a client invites a primary contractor, that contractor gains the ability to invite other workers such as masons or electricians. Favour Nwachukwu and Philip n. Tete debate whether contractors should route all additional invites through the admin or client, with Philip n. Tete establishing that primary contractors and clients retain full invitation rights while secondary invitees like family members cannot invite others (00:51:29) (00:54:22). Favour Nwachukwu confirms there are no major security risks with this workflow (00:55:56).

Stage Evidence Upload and Progression Flow: Ruth Ijoma uploads evidence files for project substages such as pillars and concrete work (00:57:31) (01:00:41). Favour Nwachukwu explains the workflow for unlocking stages: once evidence is uploaded up through the final substage and approved, a page opens to upload a payment receipt for the next stage, automatically unlocking it (00:59:09). The contractor must then acknowledge that the receipt is valid and payment has been received before work on the next stage can proceed (01:00:41).

Client Dashboard Scope and Design Consistency: Philip n. Tete outlines the required updates for the client dashboard, emphasizing design consistency with the contractor interface regarding fonts, colors, and U.S. dollar equivalent values (01:05:09) (01:13:27). Philip n. Tete directs that action buttons use brand green, terminology use "approved" instead of "verified", and redundant UI elements such as site preview updates and the "share your build" call-to-action be removed or relocated to settings under team management (01:06:51). Philip n. Tete notes that Bill of Quantities cost breakdowns function well and that initial contractor invitation prompts should disappear once the contractor is added (01:10:08) (01:13:27).

Budget Payouts and Receipt-Based Tracking: Favour Nwachukwu explains that released funds accumulate as stages progress based on predefined stage costs (01:15:03). Philip n. Tete notes that human negotiations often result in agreed payments differing from strict stage costs (01:16:29). Consequently, Philip n. Tete decides that payout tracking must use uploaded payment receipts as the definitive source of truth rather than theoretical stage costs, and Favour Nwachukwu raises no objections (01:17:44).

UI Color Scheme for Dashboard Stage Progress: Favour Nwachukwu objects to using gray for active stages on the client dashboard, arguing that gray typically indicates inactive items and suggests using amber or bright colors (01:17:44) (01:20:42). Philip n. Tete argues that using too many colors makes the product look amateurish and advocates for a clean, consistent color palette using a darker shade of gray or black to distinguish active or locked states from completed green stages (01:19:24) (01:33:27). After debating visual clarity and user comprehension, Philip n. Tete and Favour Nwachukwu agree on a compromise to use a darker shade of gray for active or locked lines alongside brand-consistent greens (01:36:36).

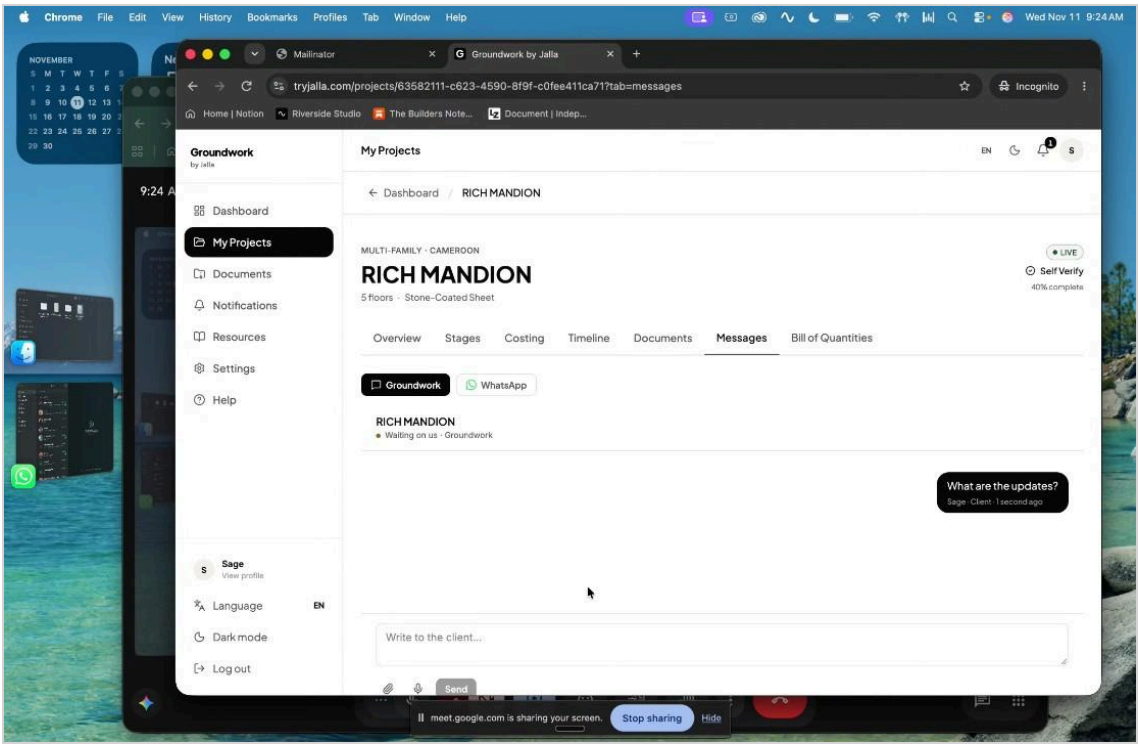

Stage Breakdown and Payment Timeline Integration: Philip n. Tete pointed out that the stage breakdown and payment timeline appeared redundant and suggested merging them into a single element while maintaining the established design pattern. Favour Nwachukwu agreed with this technical logic. Additionally, Philip n. Tete noted that project timelines needed color consistency to avoid a mix of colors, and clarified that self-verification was obsolete, as clients now solely approve updates rather than verifying them themselves (01:41:51). Favour Nwachukwu committed to investigating web previews for Excel files to resolve viewing issues (01:43:25).

Document and Certificate Visibility for Pre-Groundwork Stages: Philip n. Tete and Favour Nwachukwu discussed stages completed before groundwork began, noting that because no updates or certificates were issued for these initial stages within groundwork, they should not appear in the document or certificate sections (01:43:25). Favour Nwachukwu explained that these external stages would be verified first before certificates were issued (01:44:50). Philip n. Tete emphasized that documents must strictly reflect reality, noting that foundation site updates were currently unclickable and not visible (01:46:35). Favour Nwachukwu stated they would ensure the document states were approved and make the uploaded documents properly clickable (01:47:49).

Bill of Quantities Functionality and Access: Philip n. Tete questioned the utility and placement of the bill of quantities tab, which Favour Nwachukwu explained was used by admin and contractors to review and adjust costs when estimates were exceeded (01:49:23). Philip n. Tete noted that this function belonged on the contractor and admin

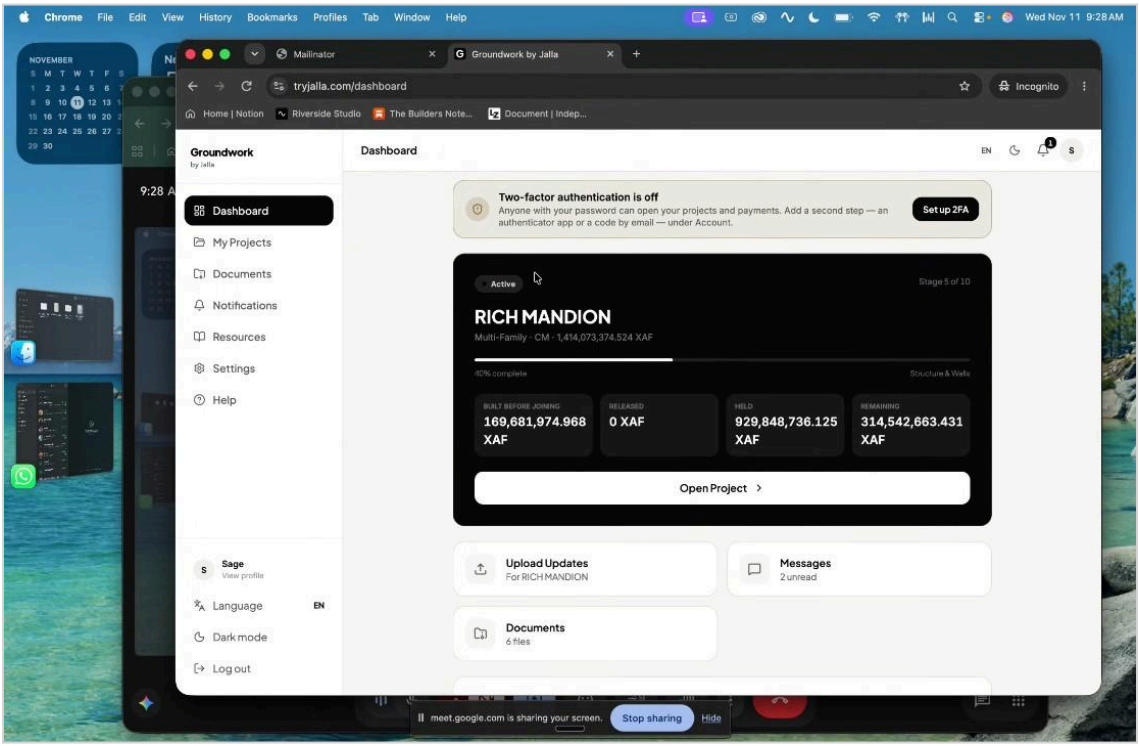

views rather than the client view (01:50:42). Furthermore, Philip n. Tete criticized the "start a takeoff" call to action as construction jargon that did not accurately reflect the action, prompting Favour Nwachukwu to agree to use a more descriptive label like "edit bill of quantity" (01:51:49).

Messaging and File Transfer Testing: Favour Nwachukwu requested a test of the messaging system, prompting Ruth Ijoma to share their screen to demonstrate incoming notifications and messages on a contractor account. Favour Nwachukwu verified that the messaging functionality worked and instructed Ruth Ijoma to test voice notes, documents, and other files (01:53:48). Favour Nwachukwu explained that voice notes included a stop button so users could add accompanying text for clarity, especially when language barriers existed, which Ruth Ijoma tested successfully (01:55:22).

Project Home Screen and Dashboard Color Updates: Philip n. Tete reviewed the project home screen, noting that clicking an inactive or on-hold project incorrectly prompted a "create start your first project" message even when it was not the first project. Favour Nwachukwu agreed to remove this prompt and display "no projects on

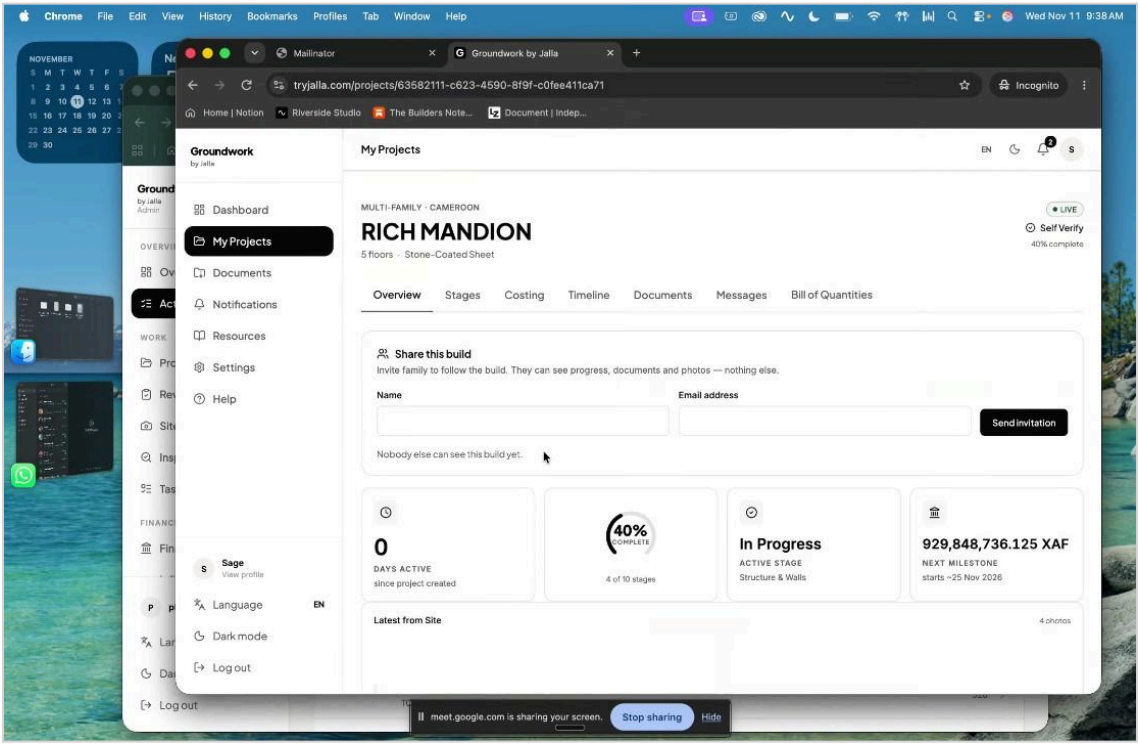

hold" instead. Additionally, Philip n. Tete instructed that the primary dashboard color must be changed from black to the green used in the contractor dashboard to serve as the primary call-to-action color, to which Favour Nwachukwu agreed (01:56:51).

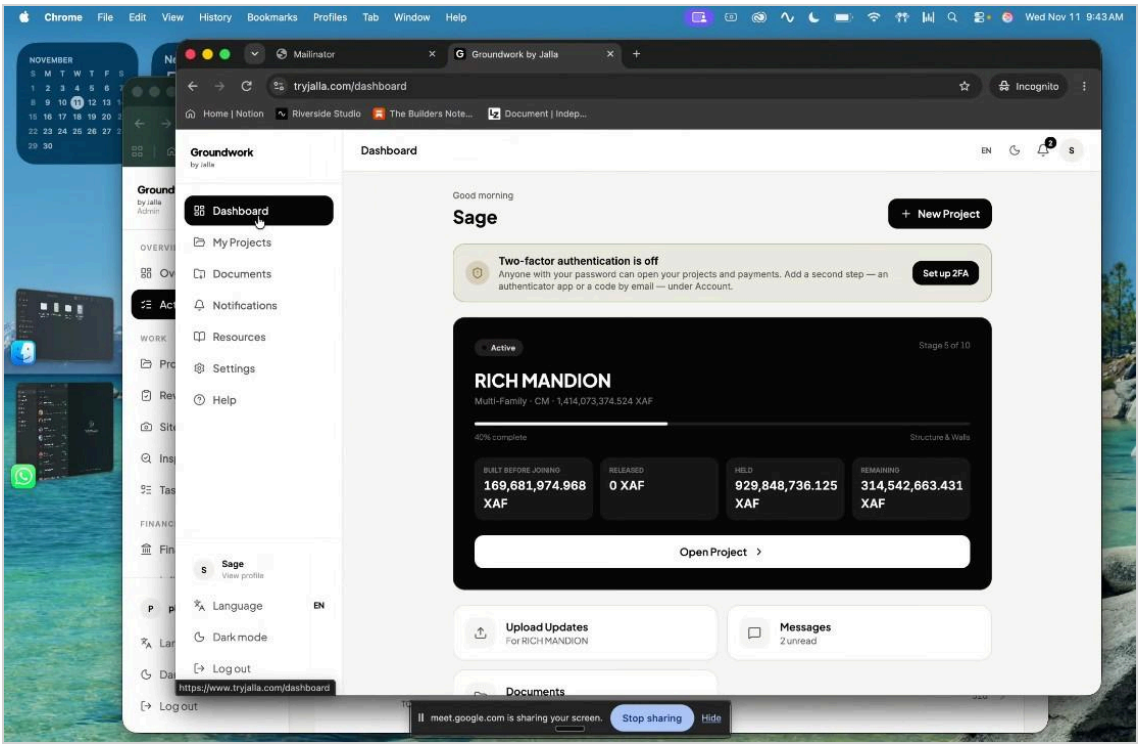

Evaluation and Removal of the Upload Updates Feature: Philip n. Tete questioned the purpose of the client-facing "upload update" feature on the main dashboard, which Favour Nwachukwu initially described as a way for clients to upload receipts, floor plans, or bill of quantities if they bypassed the contractor route (01:57:59). Philip n. Tete and Favour Nwachukwu discussed the backend execution flow, with Favour Nwachukwu noting that uploaded files triggered admin notifications under "needs your attention" (02:01:44) (02:05:29). Because the feature lacked a fully mapped-out execution flow and proper backend handling for material project changes, Philip n. Tete decided to remove the upload updates feature from the main dashboard, leaving only messages and documents (02:04:17) (02:06:38).

Resource Tab and Project Sharing Adjustments: Philip n. Tete reviewed the resources section and noted that empty tabs, such as videos, should be removed or hidden since they provided a poor user experience. Favour Nwachukwu was given the

decision to hide or take them out from a technical standpoint (02:08:10). Regarding project sharing features, Philip n. Tete and Favour Nwachukwu agreed to move the sharing function out of its current location and create a dedicated team or people tab within the project view, mirroring the contractor setup (02:09:16).

Two-Factor Authentication Action Button Adjustment: Philip n. Tete identified a usability issue where clicking the two-factor authentication setup action button on the account page failed to take the user directly to the setup section (02:10:52). Favour Nwachukwu explained that the setup feature was currently on the same page further down, making hyperlinks difficult. To prevent negative user experiences and frustration, Philip n. Tete made an executive decision to hide the action button until Favour Nwachukwu could properly route users directly to the two-factor authentication notification place (02:12:04).

Project Turnaround Timeline and Follow-Up: Following the review of all client-view product components, Favour Nwachukwu estimated a turnaround time of 4 hours to complete the requested changes. Philip n. Tete concluded the meeting, directing Ruth Ijoma to send an invitation for a follow-up meeting exactly 4 hours later (02:13:03).
