Meeting records Transcript Recording 4 Recording 2 Recording *(Some recordings unavailable)*

Summary

Pipeline tracking alignment and dashboard updates were reviewed via live working sessions.

Feedback And Pipeline Review
Feedback collection processes were established and partner application tracking metrics were defined.

Dashboard And Terminology Updates
Platform terminology, document management sections, and UI elements were restructured for consistency.

Navigation And Technical Issues
Navigation redirect bugs and mobile submission validation requirements were identified for immediate resolution.

Decisions

Aligned

- **Weekly feedback collection and review process** The team established a routine to collect feedback throughout the week and hold a review meeting every Friday to decide on implementation.
- **Partner application tracking start and end criteria** The partner application tracking starts when a user clicks next on the partner program page and ends when they click send application.
- **Call booking tracking start and end parameters** Call booking tracking must capture both the starting and ending points of the call booking process to monitor user drop-offs.
- **Contractor onboarding start and end parameters** Contractor onboarding tracking begins on the terms of service page and ends when the user selects having a project.
- **Project creation tracking start and end points** Project creation tracking starts when the user clicks the create project button and ends at the confirmation stage.
- **Criteria for defining qualified projects** A qualified project is defined as having a bill of quantities and a project start date within 60 days of creation.
- **Categorization of business project statuses** Projects are categorized into three distinct business statuses comprising general projects, qualified projects, and verified projects.
- **Client invitation tracking records and parameters** Client invitation tracking must record sent invitations along with their acceptance status.
- **Contractor dashboard layout structure and sections** The contractor dashboard layout was standardized to feature three simple sections consisting of project summaries, certified partner application progress, and active projects.
- **Continuation of live working sessions** The team agreed to continue conducting live working sessions instead of asynchronous reviews to minimize communication gaps during implementation.
- **Requirement for submitting work notes** The submit button will require a photo or a file to be added alongside a note before it works.

Next steps

- [ ] [Ruth Ijoma] Collect Feedback: Reach out to users routinely to collect real-time feedback while they use the platform. Organize the gathered feedback for weekly review sessions.
- [ ] [The group] Weekly Review: Meet every Friday to review feedback collected throughout the week. Decide which feedback to implement and prepare explanations for discarded requests.
- [ ] [Favour Nwachukwu, Philip n. Tete] Sync Review: Conduct a review session at 6:00 to evaluate the cosmetic changes and admin dashboard cards. Assess the work completed within the 90 minute window.
- [ ] [Favour Nwachukwu] Implement Platform Changes: Implement all discussed cosmetic and functional changes to the dashboard, document section, and project management flow. Complete these updates before Monday.
- [ ] [Favour Nwachukwu] Fix Data Tracking: Correct the funnel tracking logic to distinguish between signups, onboarding status, and partner applications. Ensure onboarding completion, non-completion, and application statuses are tracked as separate and clear data points.
- [ ] [Favour Nwachukwu] Track Project Creation: Implement tracking logic for project creation starting from the Create Project button and ending at the confirm stage. Ensure data capture monitors these points to analyze completion rates.
- [ ] [Favour Nwachukwu] Require Project Start Date: Update the project creation form to include a mandatory start date field. Use this field to determine project qualification status.
- [ ] [Favour Nwachukwu] Develop Project Categorization: Create a backend algorithm to automatically assign project statuses as Qualified, Verified, or General. Define qualified status by the presence of a bill of quantities and a start date within 60 days of creation.
- [ ] [Favour Nwachukwu] Update Admin Dashboard: Add status cards to the administrative dashboard to display totals for all projects, qualified projects, verified projects, and completed versus incomplete entries. Include filters for

quick navigation across these categories.

- [ ] [Favour Nwachukwu] Track Booking Funnel: Set up tracking for the beginning and end of the call booking process to identify drop-offs. Ensure the system monitors when users initiate and finalize the scheduling sequence.
- [ ] [Favour Nwachukwu] Fix redirects: Repair the help and home logo buttons to ensure they navigate to the correct dashboard views.
- [ ] [Favour Nwachukwu] Update dashboard: Remove the stage in progress widget from the project dashboard. Integrate a new widget showing certified partner application progress.
- [ ] [Favour Nwachukwu] Track project metrics: Add tracking for total, qualified, verified, and incomplete projects on the admin project dashboard.
- [ ] [Favour Nwachukwu] Track invitations: Implement monitoring for client invitations to track sent invites and their acceptance status.
- [ ] [Favour Nwachukwu] Fix Submission Logic: Implement validation logic to require a photo or file upload before enabling the submit button. Ensure this functionality works correctly on the desktop platform.
- [ ] [Philip n. Tete] Document Cosmetic Changes: Conduct a thorough review of the platform to identify and record all required cosmetic and language adjustments. Send the compiled list of changes to the developer.
- [ ] [Favour Nwachukwu] Apply Platform Changes: Update the platform with the cosmetic and language fixes once the workstation is stable. Perform these implementation tasks following the receipt of the change list.

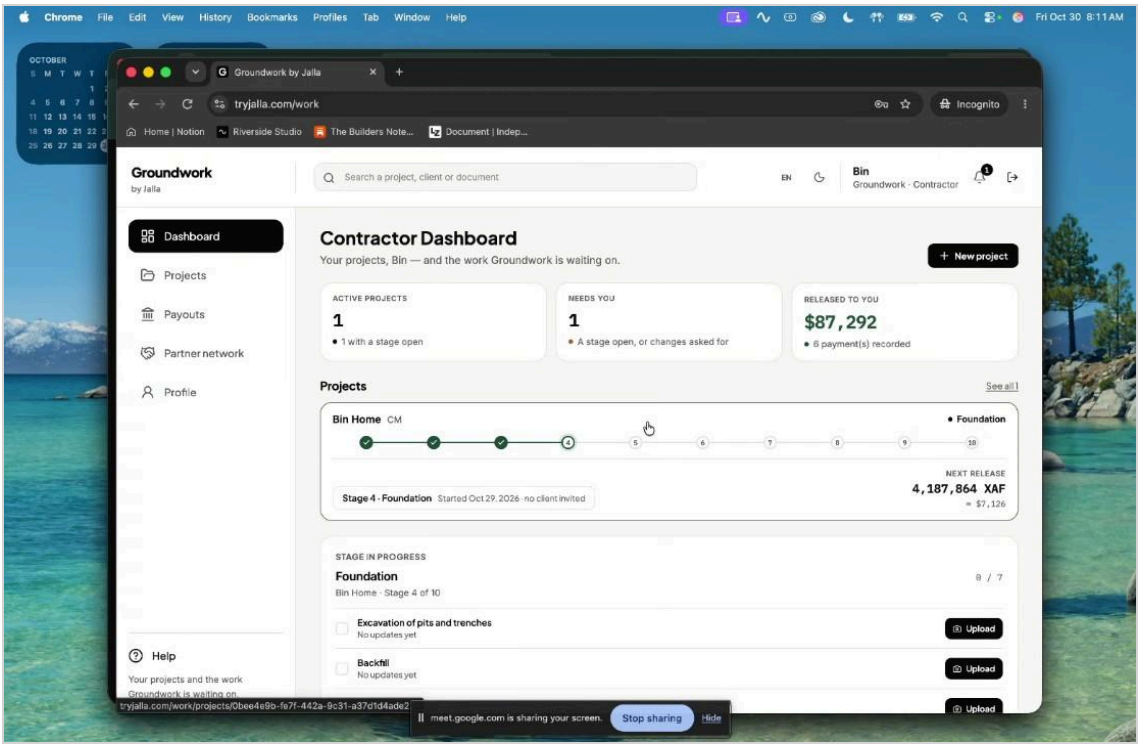

Details

Feedback Collection and Implementation Process: Philip n. Tete opened the discussion by addressing the need for a structured process to collect user feedback, synthesize it, and filter out random or out-of-scope requests. Ruth Ijoma proposed dedicating an hour every Friday to review all feedback collected from Monday to Friday, decide what to implement, and prepare explanations for items not being implemented (03:03:53). Favour Nwachukwu suggested reviewing meeting notes from recorded sessions to extract action steps. Philip n. Tete noted that many items would require direct decisions rather than discussions, but endorsed the Friday review

meeting format (03:05:06). Regarding feedback collection methods, Ruth Ijoma worried that forms or surveys would be unproductive compared to real-time feedback gathered while users interacted with the platform. Philip n. Tete agreed and instructed Ruth Ijoma to establish a routine of proactively reaching out for real-time feedback (03:06:38). Ultimately, Ruth Ijoma was tasked with gathering real-time feedback, sharing summaries with Philip n. Tete and Favour Nwachukwu on Thursdays, and participating in the Friday review meetings (03:03:53).

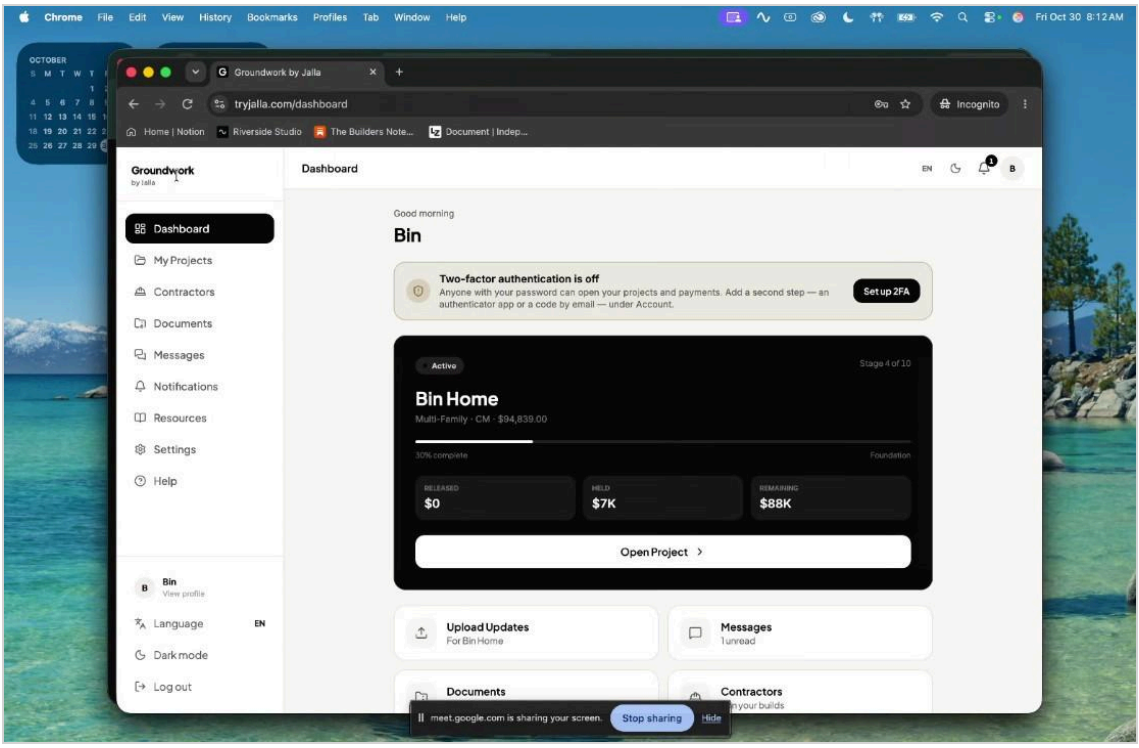

Immediate Work Review and Timeline: Favour Nwachukwu expressed concern that completing all requested fixes and building new plans would require a full eight-hour workday. When Philip n. Tete asked what could be completed immediately for a review, Favour Nwachukwu proposed meeting at 6 PM (an hour and thirty-two minutes away) after finishing cosmetic changes and contractor course work (03:07:59). Favour Nwachukwu also planned to build high-priority admin dashboard tracking cards (03:10:17). Philip n. Tete emphasized that pipeline tracking was the core foundation rather than just the visual cards, instructing Favour Nwachukwu to prioritize verifying tracking points and data cleanup (03:11:41). Favour Nwachukwu stated that a tight weekend schedule meant working during distraction-free night hours, committing to send a progress report on Saturday night and complete all reviewed tasks by Sunday night. Philip n. Tete and Favour Nwachukwu agreed to reconvene at 6 PM to review interim progress (03:09:17) (03:12:44).

Dashboard Cosmetic Changes and Language Updates: Philip n. Tete detailed specific language and text deletions required across the platform dashboard. Philip n. Tete instructed that specific placeholder text and stage tracking elements be completely deleted (01:10:15). Text reading "needs you" must be changed to "action item", and stage subtext must be removed. Philip n. Tete specified that text across all stages should be uniformly updated to "Upload photos, videos and documents to provide updates for this stage", replacing instances of "send" with "upload" (01:11:30). Favour Nwachukwu was assigned to execute these text deletions, label changes, and upload terminology updates (01:10:15) (01:33:32).

Contract and Payment Terminology Updates: Philip n. Tete reviewed financial and contractual terminology, directing that "contract value" be changed to "project value" and "fetch today" be changed to "today's rate" (01:13:58). Additionally, Philip n. Tete specified that payments on the Zap project must be recorded in Zaf with a dollar equivalent, that specific redundant statements be deleted, and that "progress of the contract" be renamed to "progress of the project" with aligned 0% progress representations (01:17:06). Favour Nwachukwu was instructed to implement these financial terminology replacements and progress alignment fixes (01:13:58) (01:33:32).

Document Management Section Rework: Philip n. Tete identified that the document management section was non-functional and required a complete rework rather than simple cosmetic adjustments (01:17:06). Philip n. Tete instructed the removal of the "who can see this" feature, the updating of language from "nothing leaves groundwork" to "everything stays organized in groundwork", and the revision of file assignment subtext. Furthermore, Philip n. Tete directed that certificates be issued when a stage is approved and that all extraneous elements in the document section be deleted. Favour Nwachukwu was assigned to execute a full structural rework of the document management section (01:19:58) (01:33:32).

Messages, People, and Client Invitation Updates: Philip n. Tete noted that the messaging feature needed re-testing. For the people section, Philip n. Tete directed that text reading "You created this project, so you own it" be deleted so that only individuals and their roles are displayed, and that access text be updated to read "You haven't given anyone access to this project yet" (01:22:04). Philip n. Tete instructed that the "invite your client" feature be moved up to appear immediately under project details on the right sidebar, accompanied by updated subtext explaining that clients receive progress updates and communication in one place. The invitation input fields were specified to collect the client's name and email address (01:23:32). Favour Nwachukwu was tasked with implementing these layout and text updates (01:22:04) (01:33:32).

Payment Records and Account Deletion Updates: Philip n. Tete raised questions regarding the origin of payment records shown without verified received payments, requesting that the label be changed to "a record of payments based on stage completion" and noting that payments are released when approved by the client (01:28:12). Philip n. Tete also instructed the deletion of unverified currency display prompts and public profile links. For account closure, Philip n. Tete specified that "close

my account" be changed to "delete my account", accompanied by subtext warning users that they will lose project data and access to clients (01:30:26). Favour Nwachukwu was instructed to implement the account deletion changes and investigate the underlying structure for payment records (01:28:12).

Review of Partner Pipeline and Tracking Metrics: Favour Nwachukwu shared their screen during the call to review the partner pipeline tracking data (01:34:59). Favour Nwachukwu reported a total of 11 partner applicants and 56 contractor accounts that had not applied. Philip n. Tete expressed confusion over the metrics when Favour Nwachukwu explained that only four applicants were tracked by the platform while others applied prior to the tracker's creation (01:36:18). Through detailed questioning, Philip n. Tete and Favour Nwachukwu clarified that out of 11 applicants, four completed the application but stopped without booking a call, three progressed to booking a call, and four stopped short due to specific form responses such as lacking a client or project (01:40:03). Philip n. Tete pointed out that starting an application differs fundamentally from selecting options like lacking a project, and demanded clearer naming conventions and distinct data sequences (01:41:11). Favour Nwachukwu explained that recent rapid changes to product flows caused the pipeline to capture legacy data inconsistently (01:44:11).

Contractor Onboarding and Partner Application Data Cleanup: Philip n. Tete established that the system needed three distinct data granulations: signups, contractor onboarding, and partner applications (01:45:34). Favour Nwachukwu reported current metrics of 168 total users, 78 contractor accounts, 29 completed onboarding profiles, 49 incomplete onboarding profiles, and 16 partner applications. Philip n. Tete questioned what criteria defined the start and end of onboarding (01:46:57). Favour Nwachukwu clarified that onboarding completion ends when contractors select either "I have a project" or "I don't have a project" and proceed to the dashboard, though recent updates regarding terms, licenses, and emergency contacts flagged some legacy accounts as incomplete (01:48:12). Philip n. Tete instructed Favour Nwachukwu to separate completed and incomplete onboarding into independent standing categories rather than using negative numbers (01:53:16). They also discussed pre-qualified counts and logic conflicts where contractor onboarding completion and partner applications both triggered off selecting "I have a project", risking double-counting (01:54:33). Favour Nwachukwu acknowledged the need to

restructure and clean up the dashboard data definitions (01:57:52).

Partner Application Tracking Trigger: Philip n. Tete and Favour Nwachukwu discussed where tracking for partner applications should initiate, emphasizing that sign-up, contractor onboarding, and partner application are three separate sequences (01:59:20). Favour Nwachukwu explained that tracking currently begins when a user navigates to the partner program page, selects their preferred language, and clicks the next button (02:00:38). Philip n. Tete verified this trigger mechanism after reviewing the process (02:02:41).

Partner Application Form Data Issues: Favour Nwachukwu and Philip n. Tete identified a testing issue where user accounts triggered auto-disqualifications due to legacy form data from an older application form regarding professional standard acceptances (02:03:48) (02:08:28). Favour Nwachukwu explained that the system recorded rather than discarded these responses because the form wasn't blocked for previously filled users. Philip n. Tete clarified that testing the application process flow was a separate scope from establishing tracking mechanics (02:03:48) (02:10:25).

Partner Application Completion Endpoint: Philip n. Tete and Favour Nwachukwu debated the final action that signals the completion of a partner application. Favour Nwachukwu initially suggested it ends with booking a calendar call, but Philip n. Tete argued that sending the application and booking a call are distinct steps, as users could complete the application and drop off beforehand (02:06:42). They reached a consensus that clicking the button to send the application serves as the final endpoint for tracking completed applications (02:07:36).

Call Booking Tracking and Endpoints: Philip n. Tete and Favour Nwachukwu discussed the requirement to track both the start and end points of call bookings following a partner application. Favour Nwachukwu explained that sending an application triggers a calendar pop-up based on the chosen language, mapping to a sent-to-booking status once completed (02:11:42) (02:14:05). Although Favour Nwachukwu questioned the necessity of tracking booking endpoints, Philip n. Tete insisted that tracking both start and end points is critical to identify drop-offs and

provide support to users who fail to complete bookings (02:14:05).

Contractor Onboarding Tracking Start and End Points: Philip n. Tete and Favour Nwachukwu established the start and end points for contractor onboarding tracking (02:15:19). Favour Nwachukwu initially suggested onboarding begins upon agreement acceptance, but Philip n. Tete argued it should begin when users enter their email address and phone number during sign-up to capture initial drop-offs (02:16:27). They agreed that contractor onboarding begins at sign-up and concludes when users select either "I have a project" or "I don't have a project" (02:15:19) (02:18:53). Ruth Ijoma participated by offering to test and share their screen to demonstrate the flow (02:17:47).

Project Creation Tracking Requirement: Philip n. Tete and Favour Nwachukwu addressed the necessity of tracking project creation, identifying it as the primary key performance indicator for business revenue. Favour Nwachukwu noted that while users with and without active projects were tracked, incomplete projects were not. Philip n. Tete asserted that aggressive tracking of both created and completed projects is essential (02:20:07). They determined that project creation tracking begins when a user clicks the "create a project" or "I have a project" button and ends at the final confirm and create stage (02:21:21).

Project Qualification and Verification Criteria: Philip n. Tete and Favour Nwachukwu defined criteria to categorize projects into general projects, qualified projects, and verified projects (02:24:13) (02:34:33). Philip n. Tete stated that a qualified project must have a bill of quantities and a timeline start date within 60 days of creation on Groundwork, whereas verified projects require active communication, client involvement, and ground updates to generate revenue (02:24:13) (02:27:15). Favour Nwachukwu suggested pulling timeline data from the calendar to determine active ongoing status, and Philip n. Tete confirmed that selecting a project start date must be made a mandatory requirement (02:29:43) (02:39:54).

Project Status Categories and Dashboard Metrics: Philip n. Tete and Favour Nwachukwu outlined the required admin dashboard metrics and status categories for

projects (02:38:32). Favour Nwachukwu and Philip n. Tete clarified that business-related statuses (general, qualified, verified) must operate independently of product-related statuses like active or inactive. Philip n. Tete specified that the project dashboard must display total projects, qualified projects, verified projects, completed versus incompleted project creations, and actionable filter cards similar to the contractor dashboard (02:41:18) (02:44:23).

Contractor and User Dashboard Metrics Breakdown: Philip n. Tete and Favour Nwachukwu detailed the required contractor metrics and dashboard filters, including sign-ups, completed versus incomplete onboarding, completed versus incomplete partner applications, qualified versus unqualified applications, and call bookings (02:47:00). Philip n. Tete added that project dashboards must also differentiate between client-brought and contractor-brought projects (02:48:56). Favour Nwachukwu and Philip n. Tete discussed the inclusion of advanced filtering capabilities to allow admin users to filter data beyond quick action summary cards (02:45:30).

Client Invitation Tracking: Philip n. Tete and Favour Nwachukwu discussed tracking client invitations sent to projects. Favour Nwachukwu noted that while the system tracks sent invitations and displays pending or accepted membership status within a project, tracking acceptance metrics specifically needed review (02:52:25). Philip n. Tete emphasized the necessity of a snapshot report showing client invitations sent and whether they are accepted or unaccepted, allowing the team to follow up with clients to move projects from qualified to verified status (02:54:08). Philip n. Tete concluded by noting that the meeting recording serves as a reference for Favour Nwachukwu to implement the discussed tracking scope (02:55:23).

Workflow Customization Feedback: Favour Nwachukwu and Ruth Ijoma brought up feedback from Mr. Chimea Joseph questioning whether platform standard stages can be modified to adapt to project types executed floor by floor rather than all at once (02:57:42). Ruth Ijoma clarified that the current stages cover the entire project, and the contractor inquired about applying stages to each individual floor (02:59:19). Favour Nwachukwu explained that structural elements, electrical, plumbing, and finishing could be structured floor by floor, though foundations and roofing (which require the entire building to be completed) would not fit this model. Philip n. Tete noted that

foundational stages differ, and Favour added that Vanessa is better positioned to provide a definitive answer (03:00:35).

Navigation and Redirect Issues: Philip n. Tete tested the implemented updates and discovered navigation errors, noting that clicking the "New Project" button incorrectly redirected users to the client view instead of remaining in the contractor view (00:02:58) (00:08:21). Philip prioritized fixing these redirect bugs immediately before proceeding with other tasks (00:04:25). Favour Nwachukwu committed to resolving the issue within 20 to 25 minutes, leading Philip to schedule a follow-up review call in 30 minutes at 8:45. During this time, Ruth Ijoma excused themself from the meeting due to another conflicting call (00:05:45).

Dashboard UI Cleanup and Caching Discrepancies: Philip n. Tete reviewed the contractor dashboard and observed an unwanted "stage in progress" widget and USD cost equivalency text that should not be displayed. Favour Nwachukwu stated they had already removed those elements and suggested the discrepancy was caused by browser caching (00:38:56) (00:43:14). Philip explained that the "stage in progress" widget adds no real value and clutters the space, outlining that the dashboard should exclusively feature top-level sections, an active projects list, and a certified partner application progress widget (00:42:03). Despite Philip using an incognito browser to clear cached data, the incorrect dashboard view persisted (00:43:14).

Working Session Methodology and Schedule: Favour Nwachukwu expressed frustration with the continuous live working sessions due to travel and time constraints, proposing an alternative asynchronous workflow where feedback is recorded via video for themself to implement independently before a final review call (00:45:55). Philip n. Tete rejected the proposal, arguing that live sessions are essential to close communication gaps and prevent redundant work (00:47:08) (00:50:02). Philip stressed that completing the workload during the current week is critical because Favour has upcoming international travel scheduled for the following week, meaning live working sessions will continue until communication alignment is achieved (00:51:05).

Dashboard Updates and Camera Access Functionality: Favour Nwachukwu reports that recent interface updates, including the removal of side elements and excavation/trashes updates, are not yet reflecting on Philip n. Tete's dashboard. Philip n. Tete questions why the take photo feature attempts an upload instead of accessing the camera (00:53:14). Favour Nwachukwu explains that camera integration and button options (take a photo or choose a file) are fully implemented for mobile devices, but require additional configuration to function properly on a personal computer. Philip n. Tete agrees to test the interface on a mobile device (00:55:41).

Mobile Submission Validation Requirements: Philip n. Tete shares a screen recording of the mobile application and confirms that users can successfully enter notes, take photos, and add files (00:57:40). However, Philip n. Tete identifies a validation issue where users are able to submit work by only typing a note without attaching a required photo or file on both mobile and computer interfaces. Favour Nwachukwu acknowledges this flaw and agrees that the system must require both a note and a photo or file before enabling the submit button (01:00:58).

Computer Performance Issues and Estimated Timeline: Favour Nwachukwu expresses concern over time management while struggling with persistent computer freezes that disrupt their workflow (01:00:58). Philip n. Tete asks to review the floor plan based on a memo once final checks are completed. Favour Nwachukwu estimates that implementing the remaining adjustments will take approximately one hour and thirty minutes, though progress is hindered by technical difficulties causing their computer to freeze (01:02:21). Philip n. Tete notes that the mobile version requires minimal adjustments, as it is mostly fine (01:03:53).

Cosmetic Changes and Meeting Conclusion: Favour Nwachukwu experiences another computer freeze shortly after getting disconnected and reconnecting. Philip n. Tete proposes reviewing language and cosmetic changes together, but due to the ongoing technical problems, Philip n. Tete decides to compile and send all required cosmetic changes via chat within thirty minutes. Favour Nwachukwu plans to restart their computer, and once stable, they will implement the changes while Philip n. Tete handles the alignment and tracking component (01:06:10).

You should review Gemini's notes to make sure they're accurate. Get tips and learn how Gemini takes notes
