GROUNDWORK BY JALLA · DAILY WORK LOG

Thursday 23 October

A day mostly spent on the **partner application funnel** — and on three things that turned out to be silently broken in production. Two of those were found only by driving the real product end to end rather than reading the code.

Prepared 24 October 2026 Covers 00:29 – 23:53 11 commits · migrations 149–159

11	80	3,758	8

01 Three live defects, found and fixed

None of these were known at the start of the day. Each was found by using the product as a real person would, and each had been failing for some time.

Contractor dossiers had never opened `158 · FIX`

Every contractor dossier on the live system failed to load — 41 of 41 — with `column d.bank_code does not exist`. A column renamed on purpose in an earlier migration was still being read under its old name.

> *Reported by Ruth: "I am unable to see contractor form details… it wasn't opening. I also refreshed multiple times."*

Draft saves were failing silently on a second device `155 · FIX`

Starting an application on a phone and continuing on a laptop made every save return a conflict error, and the applicant was told nothing at all. The draft was resolved by an id held in the browser, so a second browser minted a new one and collided.

Partner applicants could not be deleted `156 · FIX`

Deleting a test account failed outright. Two separately correct design decisions combined to forbid something neither intended — the account could not be removed while its application row still pointed at it.

02 The application form now stops where it ends

From Philip's walkthrough: if an answer disqualifies someone, they should not be walked through the remaining steps.

Disqualifying answers end the form `152 · NEW`

Two questions stopped being yes/no — "do you have an active project?" now distinguishes already running, about to start, and no — and an answer that ends the application now ends it there, with the reason recorded rather than inferred.

The board separates "turned away" from "turned down" `153 · NEW`

Someone the form stopped at question nine and someone Ruth declined after a call were collapsing into one number. They are different people needing different follow-up: one was never spoken to, the other was.

A rejection after a meeting now records why `154 · NEW`

Previously a human rejection recorded nothing. Three weeks later nobody could say what was wrong — not to answer the applicant, and not to see a pattern across several. That judgement is now captured at the moment it is made.

Finished applications stop looking abandoned `150 · NEW`

Nine of nine in-app partner drafts were sitting on the “started and gave up” list, including four people who had gone on to submit — one decision-ready and already offered a call. Nobody reading that list could tell.

03 Reporting and language

The board tells real applicants from test fixtures `151 · OPS`

Weekly cleanup meant somebody recognising by eye that one address was a fixture and another was a bricklayer. That works until the person doing it is away.

> *Ruth: “Use the admin dashboard as the data collection, not the accurate representation of reports.”*

Notifications speak the reader’s language `149 · NEW`

Bell notifications were stored as English text and shown verbatim, so a French-speaking client on an otherwise French screen read “Your budget is confirmed”. They now carry a key into the dictionary, with the stored English kept as a fallback so nothing can render blank.

French qualification calls get their own schedule `159 · OPS`

Philip has split the qualification call in two: English with Philip alone, French with Philip and Vanessa as co-host. A co-host sits on the schedule rather than the booking, so two schedules is the only way to express it.

04 What shipped, in order

MIGRATION	WHAT IT DOES
149	Notifications carry a translation key
150	A finished application closes its draft
151	The board separates staff and test rows from real prospects
152	The application stops at a disqualifying answer
153	Form rejections and human rejections are shown apart
154	A rejection after a meeting records its reason
155	A second device can save a draft
156	A partner applicant can be deleted
157	Correction to 155 — see below
158	The contractor dossier opens
159	Two booking schedules, English and French

WORTH RECORDING HONESTLY

Migration 155 was wrong, and 157 exists to correct it the same day. It changed a function without matching the original parameter order, which in PostgreSQL creates a *second* function rather than replacing the first — leaving two identical-looking candidates and breaking every call to either. Caught and fixed before it reached anyone.

Compiled from the repository history for 23 October 2026 — eleven commits between 00:29 and 23:53. Figures are counted from the commits themselves; the production findings (41 failing dossiers, nine mislabelled drafts) are the counts recorded in each migration at the time it was written.
