Communication Review

Invited Favour Nwachukwu Philip n. Tete Ruth Ijoma

Attachments Communication Review
Communication Review - 2026/11/02 16:38 EST - Recording Notes by Gemini

Meeting records Transcript Recording

Summary

Development updates and payment workflows with interface cleanup and duplicate detection evaluated.

Development Updates and Payments
Completed items include stage approvals and email communication flows. Clients must upload payment receipts to unlock subsequent project stages.

Interface Rework and Simplification
The client interface requires a complete rework to improve usability. Redundant elements on the overview page must be removed.

Duplicate Detection and Testing
System flags duplicate accounts using email addresses. Future implementation will consider device tracking for validation.

Decisions

Aligned

- **Client payment confirmation and project workflow** The client project

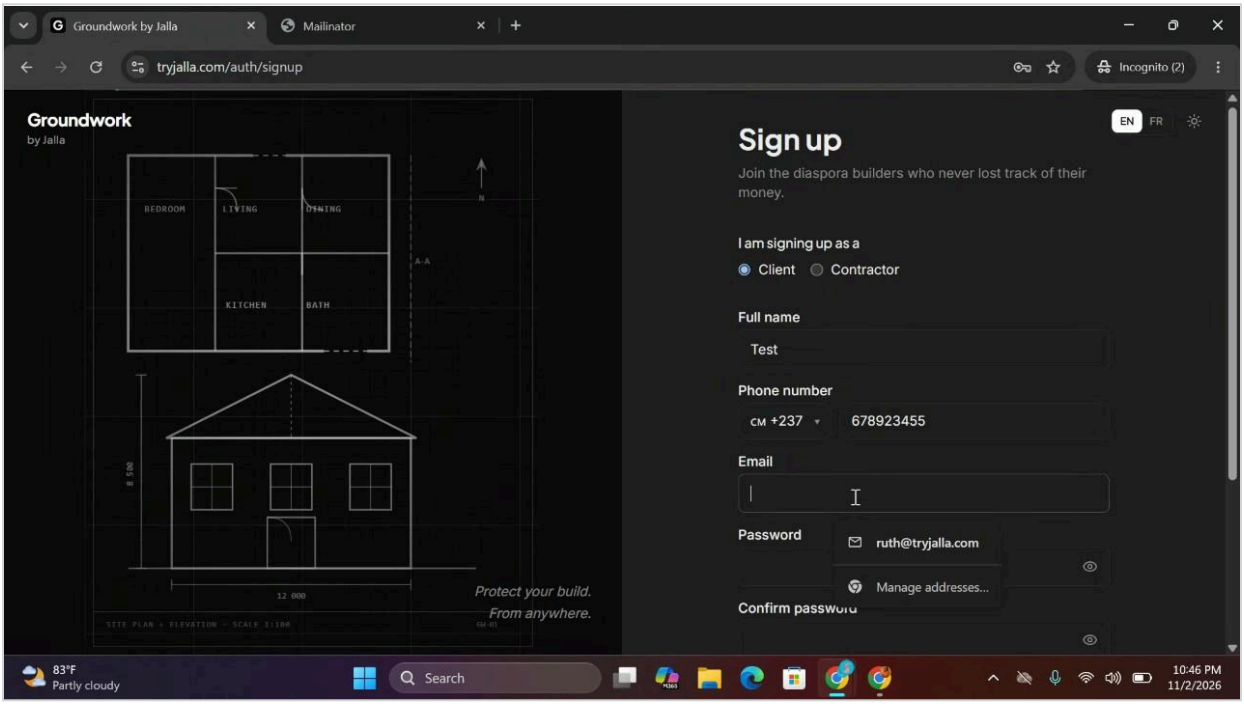

workflow requires uploading proof of payment for stage unlocking until direct payment processing is implemented.

Next steps

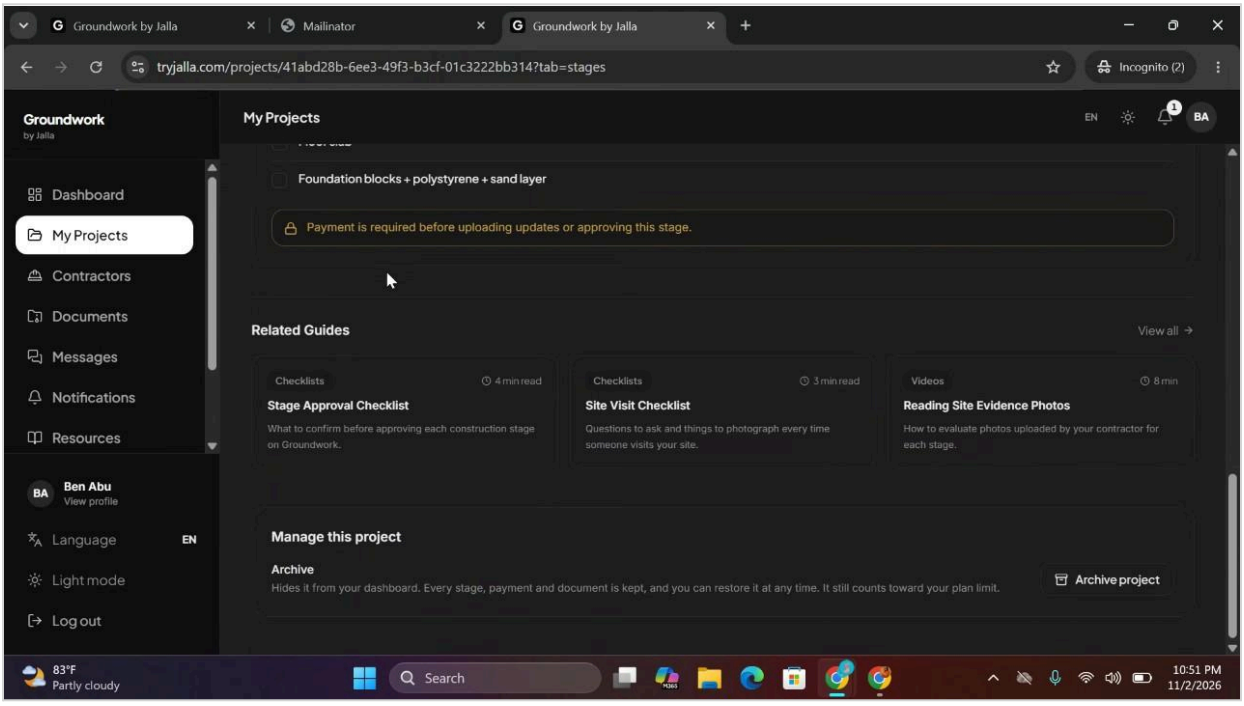

- [ ] [Favour Nwachukwu] Set Up Funnel: Configure the Go High Level funnel to capture platform triggers and enable email communication flow.
- [ ] [Favour Nwachukwu] Clean Up Client Interface: Remove unrelated guides, unused navigation links, and redundant UI elements from the client project view. Adjust button labels and flashing elements to improve user clarity.
- [ ] [Favour Nwachukwu] Map Project Flow: Define the end to end client project tracking flow including evidence uploads, payment receipt submissions, and stage unlocking logic.
- [ ] [Favour Nwachukwu] Fix Invitation URL: Update the URL within the contractor invitation emails to ensure users land on the correct project profiles instead of client profiles.

Details

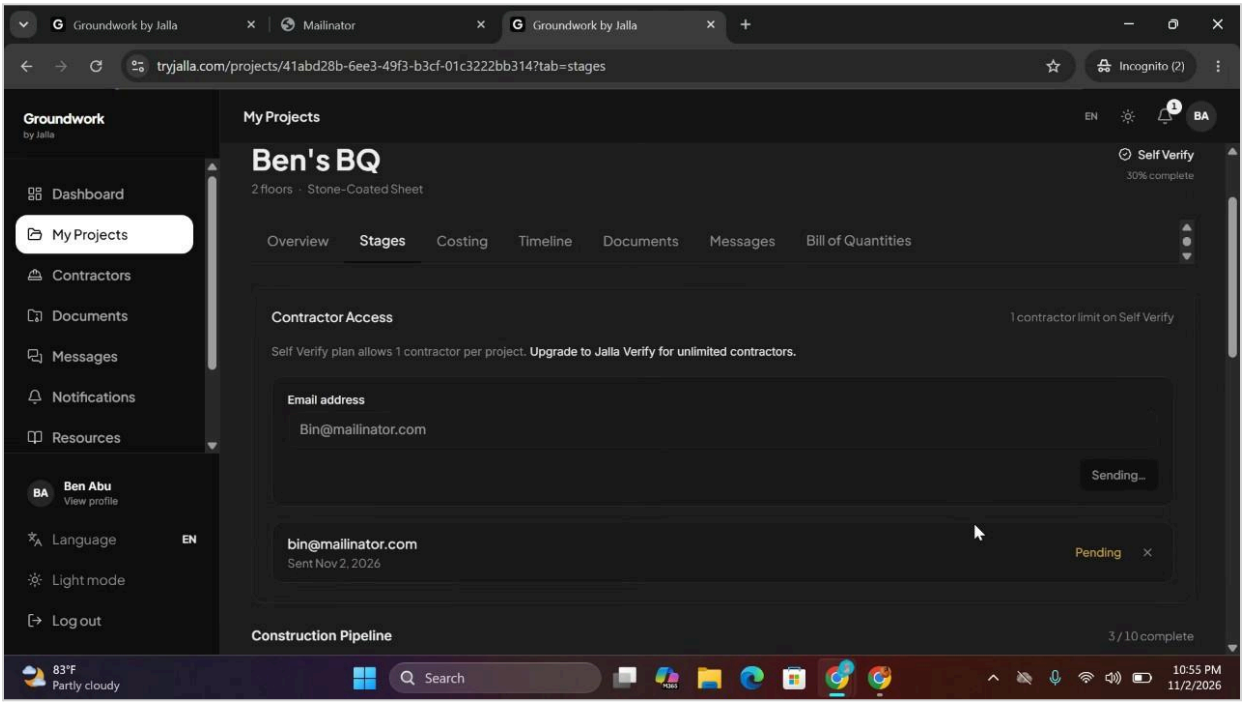

Completed Development Updates and Go High Level Integration: Favour Nwachukwu reported on completed development items, including enabling clients to approve stages, restricting contractors from creating client accounts, and structuring the 7-day human follow-up email communication flow (00:01:52). Favour Nwachukwu explained that while the system is configured to integrate with Go High Level for automated email reminders based on lifecycle events, the funnel setup within Go High Level still needs to be built and wired up. Ruth Ijoma shared their screen to create a client account as part of the live review (00:05:43).

Client Payment Workflow and Receipt Uploads: Favour Nwachukwu raised a question regarding how to manage projects where clients made direct payments to contractors midway before joining Groundwork, given that stage approval is tied to payment acknowledgment (00:10:33). Philip n. Tete clarified that the platform does not currently process payments directly, and clients must upload a receipt or proof of payment to unlock subsequent stages. Philip n. Tete noted that the client experience requires in-depth work, while the contractor experience is currently in good shape (00:14:10).

Contractor Invitation Email Source and Login Bugs: During testing of contractor invitations, Philip n. Tete questioned the source of the invite emails, noting they were coming from Supabase through Resend rather than the custom email templates put together by Philip n. Tete (00:15:40). Favour Nwachukwu acknowledged that language integration was not completed yet. Philip n. Tete and Favour Nwachukwu identified login bugs where clicking certain links incorrectly redirected users to client views, and Favour Nwachukwu committed to cleaning up these issues overnight (00:17:20).

Client Interface Rework and Usability Issues: Philip n. Tete tested uploading evidence as a contractor, noting that file uploads functioned properly once the correct buttons were selected, though camera features do not work on personal computers (00:21:13). Upon reviewing the client interface, Philip n. Tete stated that the entire client interface needs a rework, pointing out that language, button clarity, and flashing UI elements are confusing and create a poor user experience where clients do not know what actions to take (00:25:30). Favour Nwachukwu clarified references to payment requirements for evidence upload, agreeing to remove confusing elements (00:26:27).

Defining the Project Tracking and Payment Flow: Philip n. Tete outlined the mandatory project tracking and payment flow to ensure invited clients understand their responsibilities: contractors upload evidence, clients view and approve evidence stage by stage, and clients upload proof of payment such as a bank transfer receipt to unlock the next stage after contractor confirmation (00:27:41). Philip n. Tete instructed Favour Nwachukwu to remove extraneous user interface elements such as related guides and manage this project from the project view to keep the focus strictly on moving through the project. Favour Nwachukwu agreed to implement these changes (00:29:05).

Overview Page User Interface Cleanup and Simplification: Philip n. Tete reviewed the project overview page and directed Favour Nwachukwu to remove redundant elements like stage progress breakdowns and cost allocation breakdowns, noting that cost details belong in the costing section. Philip n. Tete specified that payment status should be retained but modified to clearly display the payment required to unlock the next stage rather than showing total amounts due (00:34:04). Philip n. Tete also noted that sidebars containing weather widgets and summary cards are acceptable, but budget estimates on other pages are currently confusing and need cleaning up alongside placeholder elements across multiple pages (00:35:06).

Contractor Limited Access and Duplicate Account Detection: Philip n. Tete and Favour Nwachukwu discussed testing contractor limited access and preventing users from creating multiple accounts (00:38:50). Favour Nwachukwu noted that the system currently flags duplicate accounts based strictly on email addresses (00:43:01). Philip n. Tete raised the requirement to detect duplicate users even if they use different emails and phone numbers, comparing it to Netflix's free trial detection mechanisms (00:43:57). Favour Nwachukwu and Philip n. Tete debated tracking methods, discussing device tracking versus Internet Protocol addresses and the implications for users switching between personal computers and mobile devices (00:45:16). Philip n. Tete emphasized that capturing device information will be crucial for validating evidence and geotagging, and Favour Nwachukwu noted that any expanded data collection regarding location must be properly disclosed in the terms of agreement (00:48:50). Philip n. Tete concluded that while email blocking is sufficient for now, device tracking must be considered for future implementation (00:47:31) (00:49:52).

Final Action Items and Testing Schedule: Philip n. Tete instructed Favour Nwachukwu to clean up the client user experience, map out customer flows, resolve role assignment bugs, and finalize the Go High Level setup (00:50:58). For testing, Philip n. Tete outlined a schedule for the following day: running an initial test session immediately after the morning standup for 1.5 to 2 hours, allowing Favour Nwachukwu time to make adjustments, and conducting a second test session later in the day. Philip n. Tete specified that testing will cover the email communication flow, client onboarding experiences distinguishing between invited clients and self-signups, and the newly updated client interface for stage approvals. Philip n. Tete then concluded

the session (00:52:00).
