

Testing the contractor and verifier dashboards.

What every item in each sidebar does, what you should see when you click it, and what it means when you see nothing. Written so you can test both surfaces without needing to be told what anything is.

PREPARED FOR	FROM	DATE	COVERS
Philip N. Tete	Favour Nwachukwu	3 October 2026	/work and /verifiers

TWO THINGS BEFORE YOU START

A verifier account does not exist yet. Nobody has ever logged into the verifier surface. Section 5 explains how to create the first one — until that is done, the verifier half of this guide cannot be tested at all.

One contractor screen is currently broken on the live site. Payment details cannot be saved until the database repair is applied. It is marked clearly where it appears, so you do not report it as a new fault.

THE RULE THAT GOVERNS BOTH SURFACES

A contractor sees only projects they have been assigned to. A verifier sees only verifications assigned to them personally. This is enforced in the database, not in the screen — so if either of them can see something that is not theirs, that is the most serious kind of fault you can find, and worth stopping to report.

What these two surfaces are

Groundwork is four products over one set of records. These are two of them.

SURFACE	ADDRESS	WHO IT IS FOR, AND WHAT THEY DO THERE
Admin	/admin	Jalla staff. Runs everything — the console you already have.
Client	/dashboard	The person whose house it is. Watches, funds, approves.
Contractor	/work	The builder. Reports work, uploads evidence, gets paid.
Verifier	/verifiers	The independent professional. Inspects and records a finding. Nothing else.

The two in this guide are deliberately narrow. A contractor cannot approve their own work. A verifier cannot approve a stage, release money, or see a client list. Each surface gives one person exactly the tools for one job.

Where you land when you log in

Groundwork decides from your role, in this order: **admin** → **verifier** → **contractor** → **client**. So if you give yourself the verifier role on your own admin account, you will still land on /admin; type /verifiers into the address bar to reach the verifier surface. That is deliberate, not a fault.

HOW TO TEST AS SOMEBODY ELSE, SAFELY

Use a private or incognito window for each role. Logging in as a contractor in one window and an admin in another, in the same browser, will sign you out of the first. Two separate windows is the whole trick.

The contractor dashboard

Eight items in the sidebar. Four of them are not separate pages — they jump you down the dashboard you are already on, which is worth knowing before you report a broken link.

MAP, NOT A SCREENSHOT

Drawn from the live navigation so the labels and their order are exact. Items **3, 4, 5 and 6** are anchors — they scroll the dashboard rather than loading a new page, so the address bar will show `/work#action` and similar.

Items **2 and 7** are real pages. Item **8** leaves the contractor surface for the shared profile page.

A contractor with no assignments still sees all eight items. The sidebar never changes shape; the content inside does.

1 Dashboard

/work

The landing page, and the page most of the sidebar scrolls within. A greeting by name, four counters, then the sections below.

YOU SHOULD SEE	Four counters: <i>Assigned projects</i> , <i>Stages open for work</i> , <i>Needs your action</i> , <i>Payments naming you</i> . Then a search box on narrow screens, the current project's progress, and the sections for items 3–6.
IF IT IS EMPTY	A new contractor with no assignments sees zeros and an empty projects panel. That is correct — it is not a loading failure.
WATCH FOR	A counter showing “ <i>Not available right now</i> ” rather than a number. That means a record could not be read, and it is deliberately not shown as zero — zero would be a lie. Report it if you see it.

2 My projects

/work/projects

Every build this contractor is assigned to, as cards showing how far each has got.

YOU SHOULD SEE One card per project, with “4 of 10 stages complete” and the stage currently open for work.

IF IT IS EMPTY “No projects assigned to you yet” — and the explanation that projects appear when a client or Jalla assigns them. This is the expected state for a brand-new contractor.

THE REAL TEST Assign the contractor to a project from your admin console, refresh this page, and confirm it appears. Then confirm a project they are *not* on does not.

3 Needs your action

/work#action

Work a reviewer sent back, and what they asked for. This is the contractor's to-do list.

YOU SHOULD SEE Stages marked *Rejected* or *More evidence needed*, each with the reviewer's note and a link into the project.

IF IT IS EMPTY “Nothing has been sent back to you.” That is the healthy state.

THE REAL TEST From admin, send a stage back for rework with a reason. It should appear here, with your reason visible to the contractor, within a refresh.

4 Uploads & evidence

/work#evidence

What the contractor has sent in — photos, video, documents — against the current stage.

YOU SHOULD SEE Recent evidence for the stage, as thumbnails or file entries.

IMPORTANT You cannot upload from here. The hint says so: open the project, pick the work item, then submit. That is deliberate — evidence must be attached to a specific item, not dropped loose against the project.

WATCH FOR “This file could not be opened.” Evidence files are private and opened with a temporary link; if that message appears, the link failed and it is worth reporting.

The contractor dashboard — continued

5 Documents

/work#documents

Project paperwork that has been shared with this contractor.

YOU SHOULD SEE	Files attached to the projects they are on — plans, the bill of quantities, permits.
IF IT IS EMPTY	<i>“No documents have been shared with you on this project.”</i>
THE REAL TEST	This is a good privacy check. Upload a document to a project the contractor is <i>not</i> assigned to, and confirm it does not appear here.

6 Payments

/work#payments

Money, from the contractor's point of view — and only the part that concerns them.

YOU SHOULD SEE	Releases that name this contractor as the person being paid, with the amount, the stage milestone and the status.
IF IT IS EMPTY	<i>“No payment records name you as beneficiary.”</i> A contractor on a project where money has moved to <i>somebody else</i> should still see this message.
THE WORDING MATTERS	The note reads that Groundwork records what has been funded and released, and that a licensed payment provider holds and moves the money. Groundwork never claims to hold funds. If you ever see wording suggesting otherwise, report it.

7 Payment details

/work/payouts

Where the contractor tells us how to pay them. New, and the most important thing on this surface to test once it works.

YOU SHOULD SEE	Either an empty state inviting them to add details, or their saved accounts with the number masked — the last three digits of a phone, last four of an account. The full number is never shown back.
STATUS LABELS	A new entry reads <i>Awaiting check</i> . It becomes <i>Checked</i> only after an administrator verifies it from the project's team panel. A contractor cannot mark their own details checked — try it; there is no such button, and that is the point.
THE REAL TEST	Add mobile money with a local-format number such as 670 00 00 00. It should be refused with a message asking for the country code. Then +237 670 00 00 00 should save.

KNOWN — DO NOT REPORT AS NEW

On the live site today, saving payment details **fails** for both mobile money and bank. The application and the database disagree about one field name. The repair is written and tested; it has not been applied yet. Everything else on this page can be looked at, but nothing will save until that is done.

8 View profile

/profile

The shared account page — name, email, password, two-factor authentication, language.

YOU SHOULD SEE The same profile page every role uses. The contractor sidebar disappears, because this page is outside the contractor surface.

WORTH TESTING Changing the email here. It should update in Groundwork and sync to the CRM, so the contractor stays reachable.

Testing the thing this surface exists for

The sidebar is navigation. The actual job is submitting work, and that happens inside a project rather than on the dashboard.

1 Open a project

From *My projects*, click into a build. You get three tabs: Work, Documents, Payments.

2 Find the open stage

Only one stage is open for work at a time. If none is, you will see “*Groundwork opens the next stage once the current one has been approved*” — which is correct behaviour, not a dead end.

3 Report work on an item

Choose a work item, or “the stage as a whole”, add notes, attach photos or documents, and submit.

4 Check it reached Groundwork

In your admin console the submission should appear under Site Updates against that stage, with the files.

5 Confirm what the contractor cannot do

There is no approve button, no way to mark a stage complete, and no way to release money. If you find one, stop and report it.

The verifier dashboard

Five items, and all four below the dashboard are anchors on it. This surface is deliberately the smallest in Groundwork: an independent professional records a finding, and does nothing else.

NOBODY HAS LOGGED IN HERE YET

The verifier surface has been built and reviewed, but no verifier account exists, so it has never been used by a real person. **Section 5 is how to create the first one.** Until then, everything below describes what the code will do rather than what anyone has seen it do — and that gap is exactly what your test will close.

MAP, NOT A SCREENSHOT

Note what is *absent*: no client list, no portfolio, no financials, no assignment controls, no approvals. A verifier cannot reach them, and there is no link to try.

The page header reads “*You only see verification work assigned to you. Record your independent findings here.*” That sentence is the whole product.

Items **2–5** scroll the dashboard. Clicking an assignment opens a detail page at `/verifiers/<id>`.

1 Dashboard

/verifiers

Everything, on one page: counters, the assignment list, visits, the review workspace and past decisions.

YOU SHOULD SEE	Four counters — <i>Pending verifications, Visited today, Needs findings, Recorded this week</i> — then the sections below. A search box covers assigned projects, stages and reference IDs.
IF IT IS EMPTY	“ <i>No verification assigned to you yet</i> ”, explaining that work appears here when Groundwork asks them to verify a stage. A newly created verifier should see exactly this.
ONE MESSAGE TO RECOGNISE	“ <i>Not available yet — the migration behind verifications has not been applied.</i> ” This means a database step is missing, not that the verifier has no work. It is a different fault and worth reporting as such.

2 Assigned verifications

/verifiers#assignments

The working list, with a status filter.

YOU SHOULD SEE	One row per verification: project, stage, location, when it was requested, and its status. The filter offers <i>All assignments</i> and each status.
STATUSES	<i>Awaiting your finding · Verified · Rejected · More evidence needed.</i>
IF FILTERED TO NOTHING	<i>"No assigned verifications match these filters."</i> — different from having no assignments at all, which is the empty state above.

3 Visits to arrange

/verifiers#visits

Requests with no site visit recorded yet — the verifier's "go and look at this" list.

YOU SHOULD SEE	A numbered list of projects awaiting a visit, each showing the stage, the city and how long ago it was requested. The hint tells them to arrange a visit with their project contact.
IF IT IS EMPTY	<i>"Nothing is waiting for you right now."</i>
WHY IT EXISTS	A verification cannot be marked <i>Verified</i> without a visit date. This list is what stops a verifier signing off work they never went to see.

The verifier dashboard — continued

4 Evidence & review

/verifiers#review

The working area, and the only place a verifier changes anything.

BEFORE CHOOSING	<i>“Choose an assigned verification to review its evidence and record your findings.”</i>
AFTER CHOOSING	The project and stage, the work items reported in that stage, and two tabs — Evidence submitted and Project documents . Files open through temporary private links.
THEN THE FINDING	A decision — <i>Verified</i> , <i>Rejected</i> , or <i>More evidence needed</i> — a site visit date, and a findings box. Findings are required . A visit date is required when the decision is <i>Verified</i> .
AFTERWARDS	The panel becomes read-only, showing the decision, the findings and the visit date. A verifier cannot edit a decision they have already recorded.

5 Recent decisions

/verifiers#decisions

What this verifier has already recorded — their own history, nobody else's.

YOU SHOULD SEE	Project, stage, the date decided, a coloured status and the findings text. Each links back to the full record.
IF IT IS EMPTY	<i>“No findings have been recorded yet.”</i>

The test that matters

One pass through the whole chain, which also proves the separation between the three roles.

1 Assign the verifier to a project

From admin, on the project's team panel. Give them a discipline — civil engineer, electrical engineer.

2 Have a contractor submit work

So there is evidence to look at. A verification with nothing to inspect is not a real test.

3 Request the verification

From admin, on the stage. Pick the verifier you assigned.

4 Log in as the verifier

In a separate private window. The request should be waiting, under both *Assigned verifications* and *Visits to arrange*.

5 Try to submit without findings

It should refuse: *“Add your findings before submitting.”*

6 Try to mark it Verified with no visit date

It should refuse. This is the anti-rubber-stamp rule and the single most valuable thing to confirm.

7 Record a proper finding

Decision, visit date, observations. Submit.

8 Check it in admin

The same finding, the same words, against the same stage. If admin shows something different from what the verifier typed, stop.

9 Confirm the verifier cannot approve

There should be no approve button and no way to release money. Recording a finding is an *input* to a Jalla decision, never the decision itself.

What should be impossible

A feature working is worth less than a boundary holding. These are the checks where a failure is serious — if any of them passes when it should not, stop testing and tell me.

TRY THIS	WHAT SHOULD HAPPEN	WHY IT MATTERS
As a contractor, open /verifiers	Sent to the client dashboard	Roles are separate products
As a verifier, open /work	Sent to the client dashboard	Same rule, other direction
As a contractor, open /admin	Refused	The console is staff only
As a contractor, open a project you are not assigned to by pasting its address	Refused — “ <i>This project is not assigned to you</i> ”	The address bar is not a key
As a verifier, find any client's name or a list of projects	Nothing to find	A verifier inspects work, not a business
As a verifier, approve a stage or release money	No such control exists	Jalla decides; the verifier reports
As a contractor, mark your own payment details as checked	No such control exists	Account numbers are not permission to send money
As a verifier, change a finding you already recorded	Read-only afterwards	A record of a judgement must not move
As an admin who is not an appointed verifier, open /verifiers	Sent away	Overseeing is not the same as verifying

HOW TO TELL A BOUNDARY FAILURE FROM AN ORDINARY BUG

An ordinary bug shows the wrong thing to the right person — a wrong total, a broken link, a date that will not save. A boundary failure shows *anything at all* to the wrong person. The first can wait for the next release. The second cannot.

Creating the accounts you need

You cannot test either surface without an account that holds the right role. Neither is created by signing up.

A contractor

Contractors are reviewed before they get an account — choosing "contractor" on the sign-up page leads to an application, not a login. The path is:

1 They apply

Through the public contractor application form.

2 You approve

In admin, under Applications.

3 They get a link

Emailed, letting them create their account and claim the approved application. Their phone number from the application now carries across automatically.

4 You assign them

To a project, from its team panel. Until then they log in to an empty but working dashboard.

For your own testing you can approve an application you submitted yourself with a second email address — that is the fastest way to a real contractor account.

A verifier

There is no verifier sign-up at all. A verifier is an existing Groundwork account that has been given the verifier role.

1 They create an ordinary account

Normal sign-up with email and password.

2 You grant the role

In admin, under Team — the only place the verifier role can be given.

3 You assign them to a project

With a discipline, from the project's team panel. The system refuses to assign a contractor on that project as its verifier — nobody checks their own work.

4 They log in and go to /verifiers

If they also hold another role, they will land elsewhere and must type the address.

WORTH DOING TWICE

Create **two** verifiers on the same project with different disciplines. It is how you test that each sees only their own work, and it is the arrangement the 13 September standards require — a civil engineer and an electrical engineer on the same stage. It is also where you will meet a real limit, described opposite.

What you cannot test yet

So that you do not spend an afternoon looking for something that was never built.

YOU MIGHT TRY	WHY IT WILL NOT WORK	STATE
Saving contractor payment details	The application and the live database disagree about a field name. The repair is written and tested but not applied.	BROKEN
Money actually arriving	No payment provider is connected. A release can be approved and recorded, and marked paid by hand, but nothing is sent anywhere.	NOT BUILT
Two verifiers on one stage at the same time	The system allows only one open verification per stage. Requesting a second is refused. This is the known limit behind the checkpoint work.	KNOWN LIMIT
Three foundation checkpoints	Agreed on 13 September, specified, not built. Today a stage has one verification, not three.	DESIGNED
A verifier being stopped from signing off buried work	Hold points — where the next step cannot start until an inspection passes — are specified but not built.	DESIGNED
Handover certificates from a verifier	Certificates come from a Jalla approval, not from a verifier's finding. Deliberate.	BY DESIGN

Why there are no screenshots of these two surfaces

Deliberately. The verifier surface has never been opened by a real account, so any picture of it would have to be staged. And the screenshots filed under "contractor" in the pack sent to you previously are, on inspection, the **client** dashboard — the sidebar in them reads Payments, Contractors, Resources and Settings, which is the client's navigation, not the contractor's.

Rather than illustrate this guide with the wrong surface, the sidebars here are drawn directly from the live navigation, and marked as maps. Once a contractor and a verifier account exist, I will take real screenshots and reissue this document with them.

WHAT A GOOD TEST SESSION PRODUCES

Not a list of everything that worked. A short list of: anything a person could see that was not theirs, anything that saved when it should have refused, anything that refused when it should have saved, and any message that said nothing useful. Those four are what I can act on.
