Groundwork — what was fixed

Engineering report · 17 October 2026 · Favour

> Thirty-one fixes across messaging, WhatsApp, the contractor and verifier surfaces, payments and evidence. Eight database migrations (125–132) are applied and live. Three findings changed what we thought was broken — those are first, because they matter more than the fix list.

Three things worth knowing first

The crash was Chrome, not Groundwork — and uploads were working all along.
Chrome was auto-translating the page and rewriting it underneath React, which made the whole screen collapse into “Something went wrong.” The network log proved every upload and submission returned 200 before the crash. Root cause was still ours: the page declared itself French while showing English, which is what invited the translator in. Both are fixed.

“Never screenshotted” cannot be done on the web.
Evidence now opens inside Groundwork with no download button, no file URL exposed, and right-click and drag disabled. But a screenshot is handled by the operating system before any of our code runs, and a phone pointed at a screen defeats all of it. Please don’t promise a client their photos can’t leave. If this matters commercially, the honest options are per-viewer watermarking (makes a leak traceable) or a native mobile app.

Self-verify is why the verifier saw nothing.
On a self-verifying plan no stage ever asks for independent verification, so no verification work can exist. **21 of our 24 projects are self-verify**, including *clinton*. Verifiers assigned there will now see the project, its stages and the evidence — but will never be asked to sign anything off. Test the full verifier flow on the Kribi project, which is Jalla Management. The admin screen now warns about this before you assign.

Messaging and notifications

WAS	NOW
Notification numbers invisible in dark mode	Badge colour now flips with the theme; the whole dropdown works in dark mode
Notification links opened the project overview	They open the message itself, for clients, contractors and verifiers
The Notifications page never worked	It was writing to a database column that does not exist. Everything showed unread forever, “Mark all read” did nothing, and clicking went nowhere. All three fixed
Staff email addresses shown as names in chat	Never again — and old messages were cleaned up, recovering real names where we had them
No way to tell who is speaking in a group chat	Every message shows Client / Contractor / Verifier / Jalla

Clients had no Messages at all	Sidebar entry, a working Messages page, and the dashboard shortcut now opens the conversation instead of the notifications list

WhatsApp

Messages now reach people’s phones, replies come back into the right project, and the WhatsApp button actually sends over WhatsApp — it previously could not, because every message was recorded as a Groundwork message regardless of the button pressed. Every send is logged, so “did they get it?” has an answer instead of a guess.

> **One setting still outstanding.**
> A single configuration row (*message_fanout_url*) must be added in Supabase. Until it is, no WhatsApp message leaves — silently, with nothing appearing broken. This is the last thing standing between us and a working WhatsApp round trip.

Contractor and verifier

WAS	NOW
Contractors could not upload documents	They were blocked by permissions at two separate layers. Fixed and verified with a real upload on production
Three contractor menu links led nowhere	Removed — they pointed at page sections that do not exist, which is what produced “an empty page”
Verifiers were never told they had been assigned	They now get an email that opens straight into the project, its stages and the contractor’s evidence
The verifier dashboard showed nothing	It only listed submitted work, never assignments. It now lists the builds they are on
Verifiers had no notifications, no profile page	Both added. Admins can also now remove a verifier from a project

Payments and evidence

WAS	NOW
Marking a stage paid changed nothing	It now opens the stage for work. **162 stages** are currently waiting on this
No way to record proof of a cash payment	Clients can attach a receipt when they report paying. Optional, and the admin is told either way
Evidence shown as “Photo 1 · File 2”	Real thumbnails, opening in a swipeable viewer inside Groundwork — images and video
“Mark ready for review” on self-verify projects	Now “Approve evidence completion”, since there is no reviewer on those plans
Documents section duplicated the stage tracker	Documents is documents only, with search and a filter by project. Evidence lives with its stage

What still needs doing

- **Add the WhatsApp configuration row** in Supabase — nothing reaches a phone until then.
- **Deploy the latest changes** — the evidence viewer, document search and verifier dashboard are built but not yet live.
- **Test the verifier flow on Kribi**, not clinton. Self-verify projects cannot produce verification work.
- **Check image transformation is enabled** on our Supabase plan, so thumbnails load small instead of pulling full-size photos over a site connection.
- **Decide on watermarking** if screenshot-resistance is a commercial promise we want to make.

Quality gate on every change: full type check, 2,884 automated tests passing across 151 files, clean production build. Database changes were verified against a real PostgreSQL instance before being applied, and against live data afterwards.
